Back to school :

a little bit of theory

What are we speaking about ?

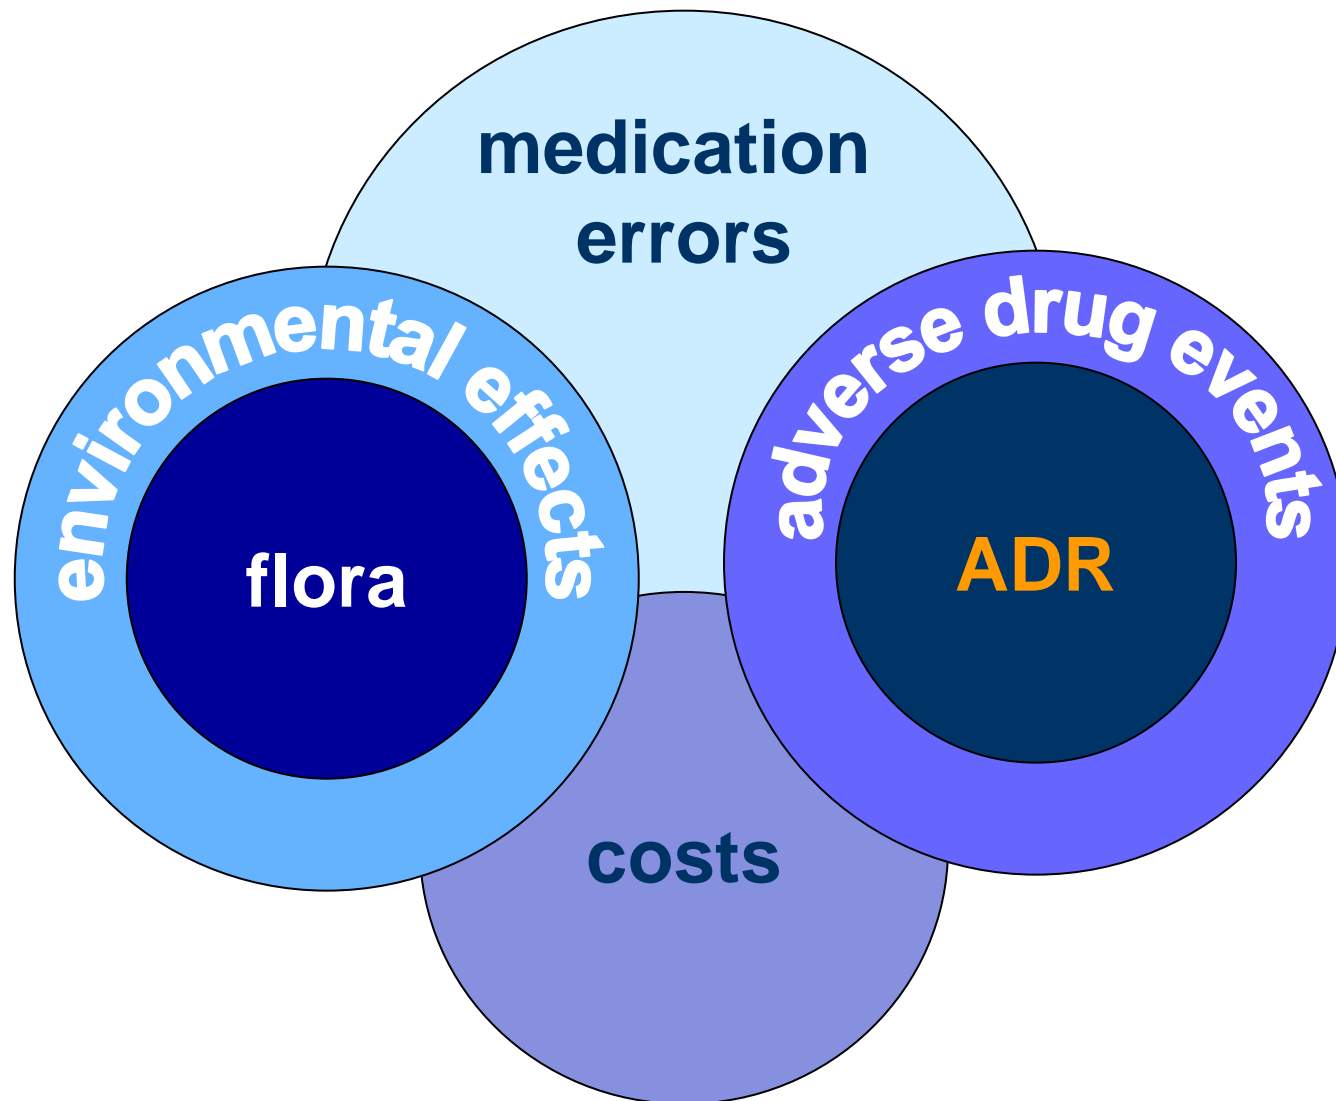

- **Adverse event** :
harm in a patient administered a drug,
but not necessarily caused by the drug
- **Adverse drug reaction** (abbreviated ADR) :
harm directly caused by a drug at normal doses

⇒ harm has occurred

- **Side effect**:
 - a usually predictable or dose-dependent effect of a drug
that is not the principal effect for which the drug was chosen
 - the side effect may be desirable, undesirable, or inconsequential

⇒ harm may have occurred

ADR within collateral effects

How to detect ADR ?

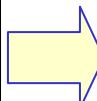

type	characteristics	interest
clinical trials	<ul style="list-style-type: none"> ▪ 5000-10,000 patients ▪ comparison with other drugs used in same indications ▪ no detection of very rare effects 	
post-marketing studies	<ul style="list-style-type: none"> ▪ larger number of patients ▪ less controlled ▪ possible detection of rare effects 	
spontaneous reports to pharmacovigilance systems	<ul style="list-style-type: none"> ▪ no estimation of incidence possible ▪ largely dependent on GP attention and on number of prescriptions 	
case - non case studies	<ul style="list-style-type: none"> ▪ estimation of risk for rare ADR 	
case reports	<ul style="list-style-type: none"> ▪ often only source for very rare ADR 	

How to categorize ADR ?

- Type :

What about antibiotics ?

type	definition
A	augmented pharmacologic effects (dose dependent and predictable)
B	bizarre effects (or idiosyncratic) (dose independent and unpredictable)
C	chronic effects
D	delayed effects
E	end-of-treatment effects
F	failure of therapy

- 
- PK issues (tissue accumulation)
 - lack of specificity for procaryotic target

- 
- often rare but serious
 - not detected before large-scale usage

- 
- clinical or microbiological
 - emergence of resistance

How to categorize ADR ?

- Severity :

What about antibiotics ?

Serious ADR	
death	
life-threatening	➡ often related to unpredictable effects
hospitalization (initial or prolonged)	
disability - significant, persistent, or permanent change, impairment, damage or disruption in the patient's body function/structure, physical activities or quality of life	➡ importance of monitoring
requires intervention to prevent permanent impairment or damage	
congenital anomaly	➡ pregnancy as a CI for most AB classes

How to categorize ADR ?

- Relatedness to drug :

degree	criteria	Response to dechallenge
certain	<ul style="list-style-type: none"> plausible time relationship to drug administration cannot be explained by concurrent disease / drugs 	clinically plausible
probable likely	<ul style="list-style-type: none"> reasonable time sequence to drug administration unlikely to be attributed to concurrent disease / drugs 	clinically reasonable
possible	<ul style="list-style-type: none"> reasonable time sequence to drug administration could also be explained by concurrent disease / drugs 	lacking or unclear
unlikely	<ul style="list-style-type: none"> temporal relationship to drug administration makes a causal relationship improbable other drugs / underlying disease provide plausible explanations 	-

need to be critically examined
in post-marketing studies

How to categorize ADR ?

- Frequency :

definition	frequency
very frequent	$\leq 1/10$
frequent	$\leq 1/100$
not frequent	$\leq 1/1,000$
rare	$\leq 1/10,000$
very rare	$\leq 1/100,000$

Importance of all types
of post-marketing surveillance systems
(phase IV)

Which type of ADR can limit antibiotic use ?

weigh the benefit-risk ratio !

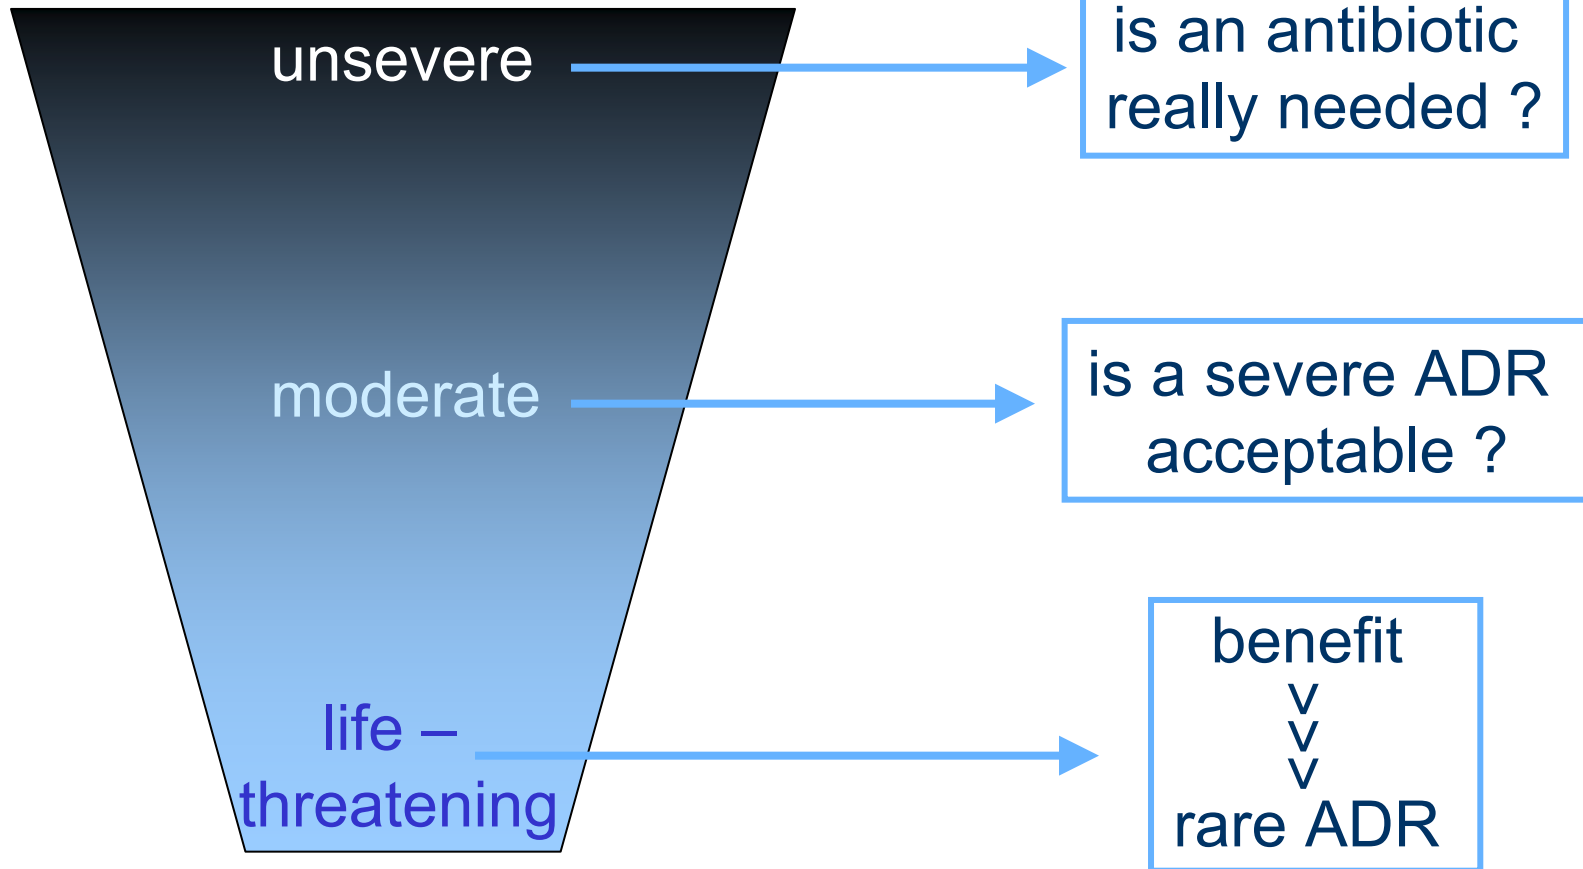

Which type of ADR can limit antibiotic use ?

benefit :

depends on
the severity of infection

risk :

what shall you accept ?

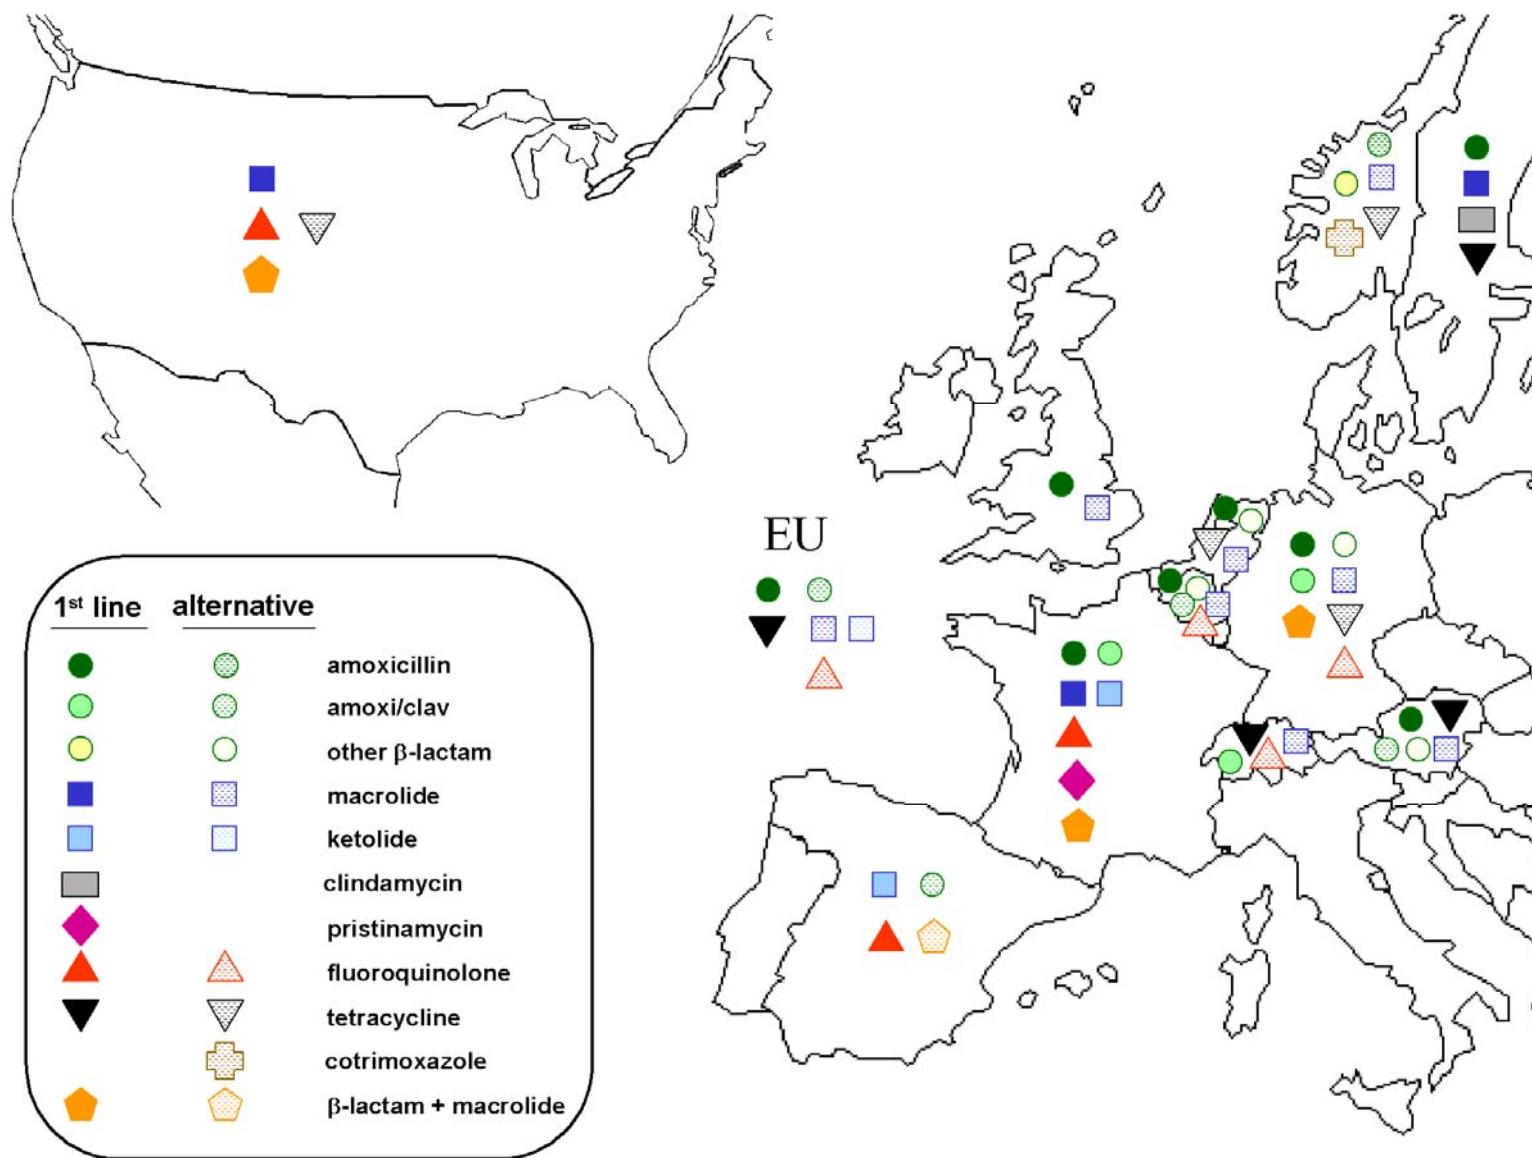

Safety profile of the most widely used antibiotics

Antibiotics recommended in CAP (outpatients)

Carbonnelle et al., ICC (2009) poster 315

ADR with antibiotics recommended in CAP (SmPC)

Class	Most frequent or serious ADR
β-lactams (AMX-CLAV)	<ul style="list-style-type: none"> • Anaphylactic reactions • <i>Clostridium difficile</i> -associated colitis • Digestive tract: diarrhoea, nausea • Hepatic toxicity, including hepatitis and cholestatic jaundice • CNS : agitation, anxiety, insomnia, confusion, convulsions, ...
Macrolides (CLR/AZI)	<ul style="list-style-type: none"> • Drug interactions (CYP450) • <i>Clostridium difficile</i> -associated colitis • Digestive tract: diarrhoea, nausea, vomiting, abnormal taste • Hepatic toxicity, including hepatitis and cholestatic jaundice • Cardiac toxicity (arrhythmias, TdP) • CNS: headache, confusion, ...
Ketolides (TEL)	<ul style="list-style-type: none"> • Visual disturbance • Loss of consciousness • Respiratory failure in patients with myasthenia gravis
Tetracyclines	<ul style="list-style-type: none"> • Anaphylactic reactions and allergic skin reactions • <i>Clostridium difficile</i> -associated colitis • Digestive tract: anorexia, dysphagia, nausea, vomiting, diarrhoea, ... • Esophagitis and esophageal ulcerations • Hepatotoxicity • Photosensitivity • Blood cells: hemolytic anaemia, neutro-/ thrombocytopenia, eosinophilia

ADR with antibiotics recommended in CAP (SmPC)

Class	Most frequent or serious ADR
Fluoroquinolones (LVX/MXF)	<ul style="list-style-type: none"> • Anaphylactic reactions and allergic skin reactions • <i>Clostridium difficile</i> -associated colitis • Digestive tract: nausea, diarrhoea • Musculoskeletal (tendinopathies) and cartilage toxicity • Prolongation of the QTc interval and isolated cases of torsade de pointes • Hematologic toxicity • Hepatotoxicity • CNS effects: headache, insomnia, dizziness, convulsions • Peripheral neuropathy • Photosensitivity
Sulfamides (SMX/TMP)	<ul style="list-style-type: none"> • Anaphylactic reactions and allergic skin reactions • <i>Clostridium difficile</i> -associated colitis • Digestive tract: anorexia, dysphagia, nausea, vomiting, diarrhoea, ... • Blood cells: agranulocytosis, anemia, thrombocytopenia, leukopenia, neutropenia, hypoprothrombinemia, methemoglobinemia, eosinophilia • Metabolic and Nutritional: hyperkalemia

Examples :
2 life-threatening ADR
critically examined by registration authorities

- hepatotoxicity

- cardiotoxicity

Toronto City Hall

Hepatotoxicity

- Usually **idiosyncratic** (can be associated with other allergic reactions). ¹
- **Clavulanic acid**: genetic deficiency in glutathione S-transferases ? ²
(longer latency period than other antibiotics...)
- **Macrolides**: related to reactive metabolites (nitrosoalkanes) that covalently bind to proteins, forming modified antigens (immunoallergic hepatitis) ³
- **Tetracyclines**: related to inhibition of mitochondrial β -oxidation of fatty acids ⁴
- **Fluoroquinolones**: remains anecdotal and unpredictable,¹ except for molecules with substituent-generating reactive intermediates
 - difluoroaniline (temafloxacin and trovafloxacin) ⁵
 - cyclopropylamine (trovafloxacin; for which co-exposure to lipopolysaccharide may also be critical) ⁶

Annals of Internal Medicine

ARTICLE

Brief Communication: Severe Hepatotoxicity of Telithromycin: Three Case Reports and Literature Review

Kimberly D. Clay, MD, MPH; John S. Hanson, MD; Scott D. Pope, PharmD; Richard W. Rissmiller, MD; Preston P. Purdum III, MD; and Peter M. Banks, MD

Background: Telithromycin is a ketolide antibiotic approved by the U.S. Food and Drug Administration for acute bacterial infections causing sinusitis, bronchitis, and community-acquired pneumonia.

Objective: To describe 3 cases of severe hepatotoxicity in patients receiving telithromycin.

Design: Case reports.

Setting: A tertiary care medical center.

Patients: 3 previously healthy patients who had recently taken telithromycin and took no other prescription medications.

Measurements: Serologic, histologic, and liver function tests.

Results: Within a few days of receiving telithromycin, the patients presented with acute hepatitis. All had jaundice and markedly ab-

normal results on liver function tests. Results of viral serologic tests were negative. One patient spontaneously recovered, 1 required orthotopic liver transplantation, and 1 died. Histologic examination in the latter 2 patients showed massive hepatic necrosis.

Limitations: Two patients had some history of alcohol use. The frequency of severe telithromycin-related hepatotoxicity cannot be established with case reports.

Conclusions: Telithromycin can cause severe hepatotoxicity. Caution is advised in prescribing this drug pending additional postmarketing surveillance data.

Ann Intern Med. 2006;144:415-420.

FDA Advisory Panel: Ketek Side Effects Risks Outweigh Benefits For Bronchitis And Sinusitis; Urges Patient Medication Guide When Used For Pneumonia

In mid-December 2006, after two days of hearings, an FDA advisory panel recommended that the antibiotic Ketek should not be used as treatment for acute bacterial exacerbation of chronic bronchitis nor acute bacterial sinusitis. The same FDA panel, which included drug-safety experts and infectious-disease specialists, voted in favor of allowing Ketek to continue to be prescribed for community-acquired pneumonia, a more serious medical condition.

Telithromycin : new warnings (SmPc)

WARNINGS

Hepatotoxicity

Acute hepatic failure and severe liver injury, in some cases fatal, have been reported in patients treated with KETEK. These hepatic reactions included fulminant hepatitis and hepatic necrosis leading to liver transplant, and were observed during or immediately after treatment. In some of these cases, liver injury progressed rapidly and occurred after administration of a few doses of KETEK. (See **ADVERSE REACTIONS**.)

Visual disturbances*

KETEK may cause visual disturbances particularly in slowing the ability to accommodate and the ability to release accommodation. Visual disturbances included blurred vision, difficulty focusing, and diplopia. Most events were mild to moderate; however, severe cases have been reported.

Loss of Consciousness*

There have been post-marketing adverse event reports of transient loss of consciousness including some cases associated with vagal syndrome.

Ketek is contraindicated in patients with **myasthenia gravis**. There have been reports of fatal and life-threatening respiratory failure in patients with myasthenia gravis associated with the use of Ketek. (See **CONTRAINDICATIONS**.)

Linezolid : avoiding prolonged treatment (SmPC)

WARNINGS

Myelosuppression (including anemia, leukopenia, pancytopenia, and thrombocytopenia) has been reported in patients receiving linezolid. In cases where the outcome is known, when linezolid was discontinued, the affected hematologic parameters have risen toward pretreatment levels. Complete blood counts should be monitored weekly in patients who receive linezolid, particularly in those who receive linezolid for longer than two weeks, those with pre-existing myelosuppression, those receiving concomitant drugs that produce bone marrow suppression, or those with a chronic infection who have received previous or concomitant antibiotic therapy. Discontinuation of therapy with linezolid should be considered in patients who develop or have worsening myelosuppression.

Peripheral and Optic Neuropathy

Peripheral and optic neuropathy have been reported in patients treated with ZYVOX, primarily those patients treated for longer than the maximum recommended duration of 28 days. In cases of optic neuropathy that progressed to loss of vision, patients were treated for extended periods beyond the maximum recommended duration. Visual blurring has been reported in some patients treated with ZYVOX for less than 28 days.

Subject: Withdrawal of Vibativ[®], (telavancin), 15 mg/ml, powder for concentrate for solution for infusion - EMEA/H/C/000864//0000

Dear Dr. Abadie,

I would like to inform you that, at this point of time, Astellas Pharma Europe B.V. has taken the decision to withdraw the application for Marketing Authorisation of Vibativ[®], (telavancin), 15 mg/ml, powder for concentrate for solution for infusion, which was intended to be used for the treatment of complicated skin and soft tissue infections in adults.

This withdrawal is based on the following reason:

Astellas has taken this decision based on the CHMP's communication that the data provided are not sufficient to allow the Committee to conclude a positive benefit-risk balance for Vibativ for the applied indication at this time. Astellas currently intends to prepare a new marketing authorisation application (MAA) to include new and expanded clinical trial data in patients with Hospital Acquired Pneumonia, not available at the time of the initial application.

■ A **Strong inhibitor** is one that causes a > 5-fold increase in the plasma AUC values or more than 80% decrease in clearance.
 ■ A **Moderate inhibitor** is one that causes a > 2-fold increase in the plasma AUC values or 50-80% decrease in clearance.
 ■ A **Weak inhibitor** is one that causes a > 1.25-fold but < 2-fold increase in the plasma AUC values or 20-50% decrease in clearance.
 ■ All other inhibitors.

Useful databases: drug interactions ...

The screenshot shows the Drugs.com website interface. At the top, there's a navigation bar with 'Bookmarks', 'Tools', and 'Help'. Below it is a search bar with the URL 'http://www.drugs.com/drug_interactions.html'. The main header features the 'Drugs.com' logo and a search bar with the placeholder 'enter a search term...'. To the right of the search bar are buttons for 'Drug Search' and 'Web Search'. Below the header is a navigation menu with links: 'Home', 'News', 'Drugs A to Z', 'Drugs by Condition', 'Pill Identifier', 'Interactions Checker' (which is highlighted), 'Community', and 'More'. On the left side, there's a 'Services' section with links to 'Home', 'A to Z Drug List', 'Drugs by Condition', 'Drug Side Effects', 'Community Forums', 'Interactive Tools', 'Pill Identifier', 'Interactions Checker', 'MedNotes BETA', 'Medicare Part D Selector', 'Drug Image Search', and 'Phonetic Search'. The main content area is titled 'Interactions Checker' and 'Drug Interactions Checker'. It contains a paragraph explaining that a drug interaction occurs when the effect of a part with another drug, or with food. Below this, it states that the Drug Interactions Checker explains the mechanism of significance of the interaction (major, moderate) and provides the recommended course of action to manage the interaction. It also mentions that the Checker will also display any interaction between two drugs. A section titled 'In order to proceed to the Drug Interactions Checker, enter the following terms.' is followed by a search result box. The search result box is titled 'erythromycin and dihydroergotamine Interactions' and contains the following text: 'Interaction(s) found: erythromycin and dihydroergotamine (Major Drug-Drug)'. Below this, it states 'CONTRAINDICATED: Coadministration with certain macrolide antibiotics may significantly increase the plasma concentrations of ergot derivatives. The mechanism is macrolide inhibition of CYP450 3A4, the isoenzyme responsible for the metabolic clearance of ergotamine and related drugs. Macrolides that may significantly inhibit CYP450 3A4 include clarithromycin, erythromycin and troleandomycin, and clinical ergotism has been reported in patients receiving ergotamine or dihydroergotamine with these agents. Azithromycin and dirithromycin are generally believed to have little, if any, effect on CYP450 3A4.' Below this, it states 'MANAGEMENT: Given the potential for ergot toxicity characterized by peripheral vasospasm, ischemia, thrombosis, tachycardia and hypertension, concomitant use of ergot derivatives with clarithromycin, erythromycin, or troleandomycin is considered contraindicated. Although clinical data have not been reported, some manufacturers also consider the combination of cabergoline with macrolides contraindicated or to be avoided on theoretical grounds. Azithromycin may be a safer alternative during therapy with ergot derivatives.'

Take home message ...

Take home message ...

- post-marketing surveillance are needed for detection of rare/severe ADR
 - careful examination of these cases to define link with drug and associated risk factors
- safety profile should contribute to define
 - indications
 - treatment duration
 - conditions of use and of monitoring
- drug interactions are important to take into account for :
 - PK/PD issues and associated risk of failure
 - increased risks of toxicity

Thank you for your attention

... and have a nice day !
