

# Discovery of new antibiotics: Why and some approaches... \*

**Paul M. Tulkens, MD, PhD \***

Cellular and Molecular Pharmacology &  
Centre for Clinical Pharmacy  
Louvain Drug Research Institute  
*Université catholique de Louvain*, Brussels, Belgium

<http://www.facm.ucl.ac.be>

**International University - Vietnam National University, Ho Chi Minh City, Vietnam**

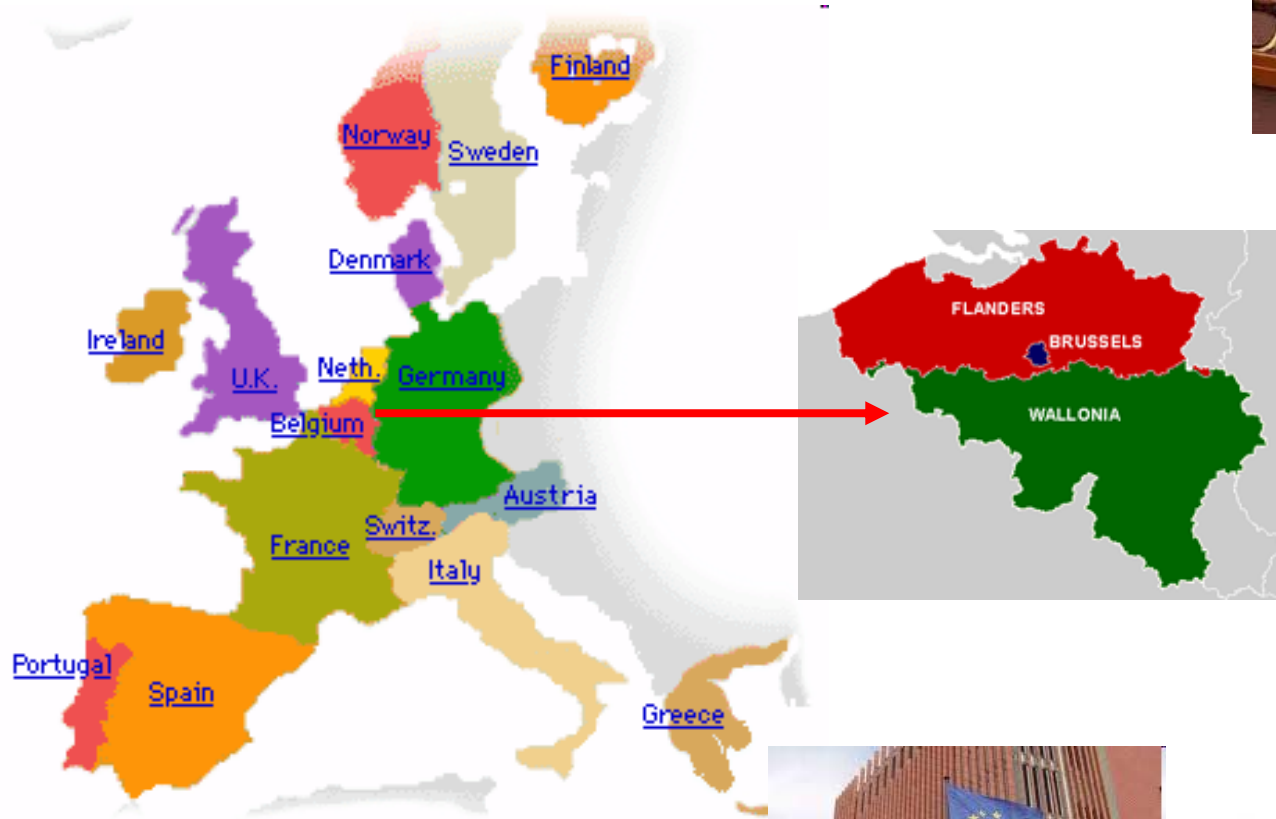

---

\* with a short presentation of Belgium and the *Université catholique de Louvain* (slides 3-9)

# Contents of the presentation

- Belgium: where is it ? (slide 3)
- The Catholic University of Louvain (slides 4-9)
- The antibiotic crisis: a pictorial view (slides 10-18)
- Public Health Approaches (very brief) (slides 19-25)
- Actions based on knowledge of resistance / toxicity patterns
- Examples of discovery of novel molecules (a personal selection)
  - ill-exploited targets: D-Ala-D-Ala ligase inhibitors
  - refurbishing old antibiotics: novel aminoglycosides
  - restarting from old compounds: novel polymyxins
  - expanding the spectrum of old antibiotics: temocillin
  - fine-tuning existing drugs: finafloxacin - delafloxacin

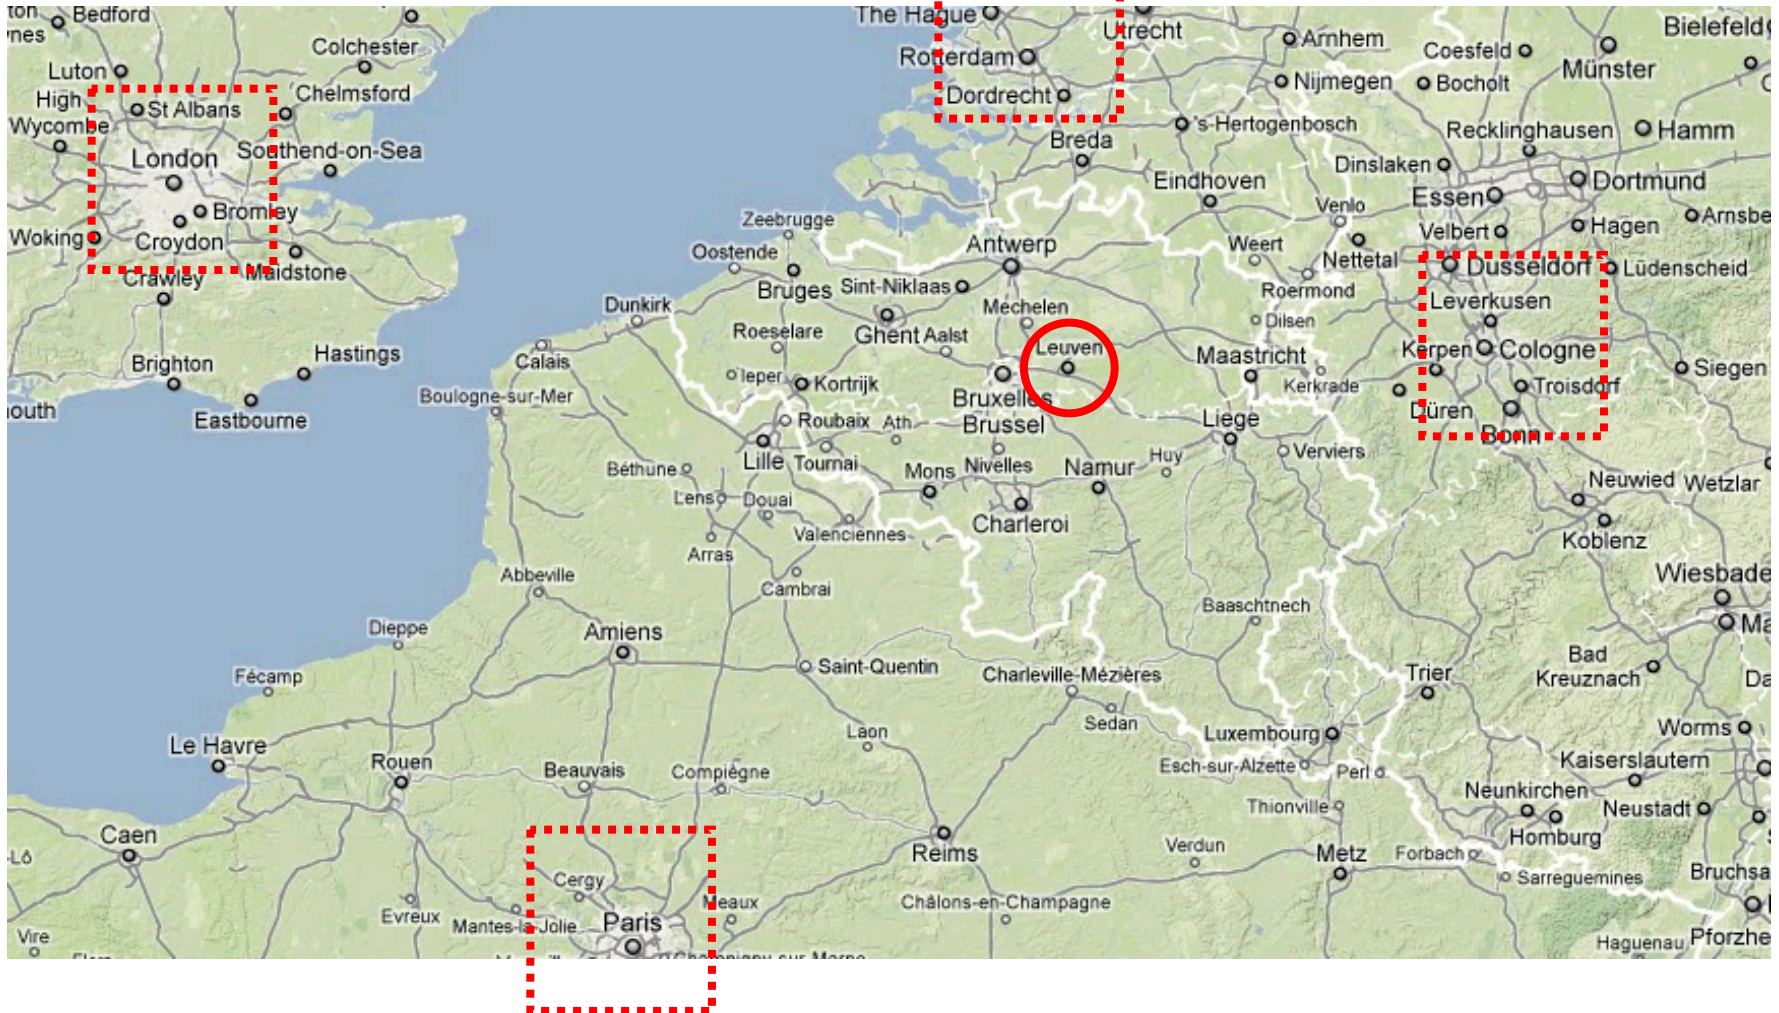

# Belgium

# The Catholic University of Louvain in brief (1 of 5)

- originally founded in 1425 in the city of **Louvain** (in French; known as **Leuven** in Flemish)

# The Catholic University of Louvain in brief (2 of 5)

- It was one of the major University of the so-called "Low Countries" in the 1500 – 1800 period, with famous scholars and discoverers (Vesalius for anatomy, Erasmus for philosophy, ...). Teaching was in Latin, Greek, and Hebrew (College of the 3 languages...)

**The University in the 1500's**

**Erasmus**

**Vesalius**

# The Catholic University of Louvain in brief (3 of 5)

- The University was closed by the French when invading the "Low Countries" in 1791 but re-opened in 1831, always in Louvain
- Teaching was in French until the early 1900's, when a Flemish-speaking section was opened and courses were given in both languages, attracting many students and celebrities...

Albert Einstein in conversation with Prof. G. Lemaître, professor at the *Université catholique de Louvain*, who, in 1927, published a paper \* in which he showed that the Universe had to be unstable and expanding from a primeval atom...

\*Un Univers homogène de masse constante et de rayon croissant rendant compte de la vitesse radiale des nébuleuses extra-galactiques". *Annales de la Société Scientifique de Bruxelles* 47: 49. Bibcode 1927ASSB...47...49L.

[In French](#) – [In English](#)

- The University was later divided into a French-speaking **Université catholique de Louvain** and a Flemish-speaking **Katholieke Universiteit Leuven**...

# The Catholic University of Louvain in brief (4 of 5)

- Because Louvain is a Flemish-speaking city, the French-speaking ***Université catholique de Louvain*** moved in 1968-1976 from Louvain to
  - Brussels for the Faculty of Medicine and associated schools (Pharmacy, Dentistry, and so on ...)
  - Louvain-la-Neuve for all other Facultieswhile keeping the name of "Louvain" in both French and English (thus, **Catholic University of Louvain**)

**Since 2010, the University has 2 main campuses and 4 smaller ones, with a total of about 30,000 students**

**<http://www.uclouvain.be>**

# The Catholic University of Louvain in brief (5 of 5)

- The Flemish-speaking ***Katholieke Universiteit Leuven*** has remained in Louvain (Leuven) and is named in English "**Catholic Universiteit Leuven**".

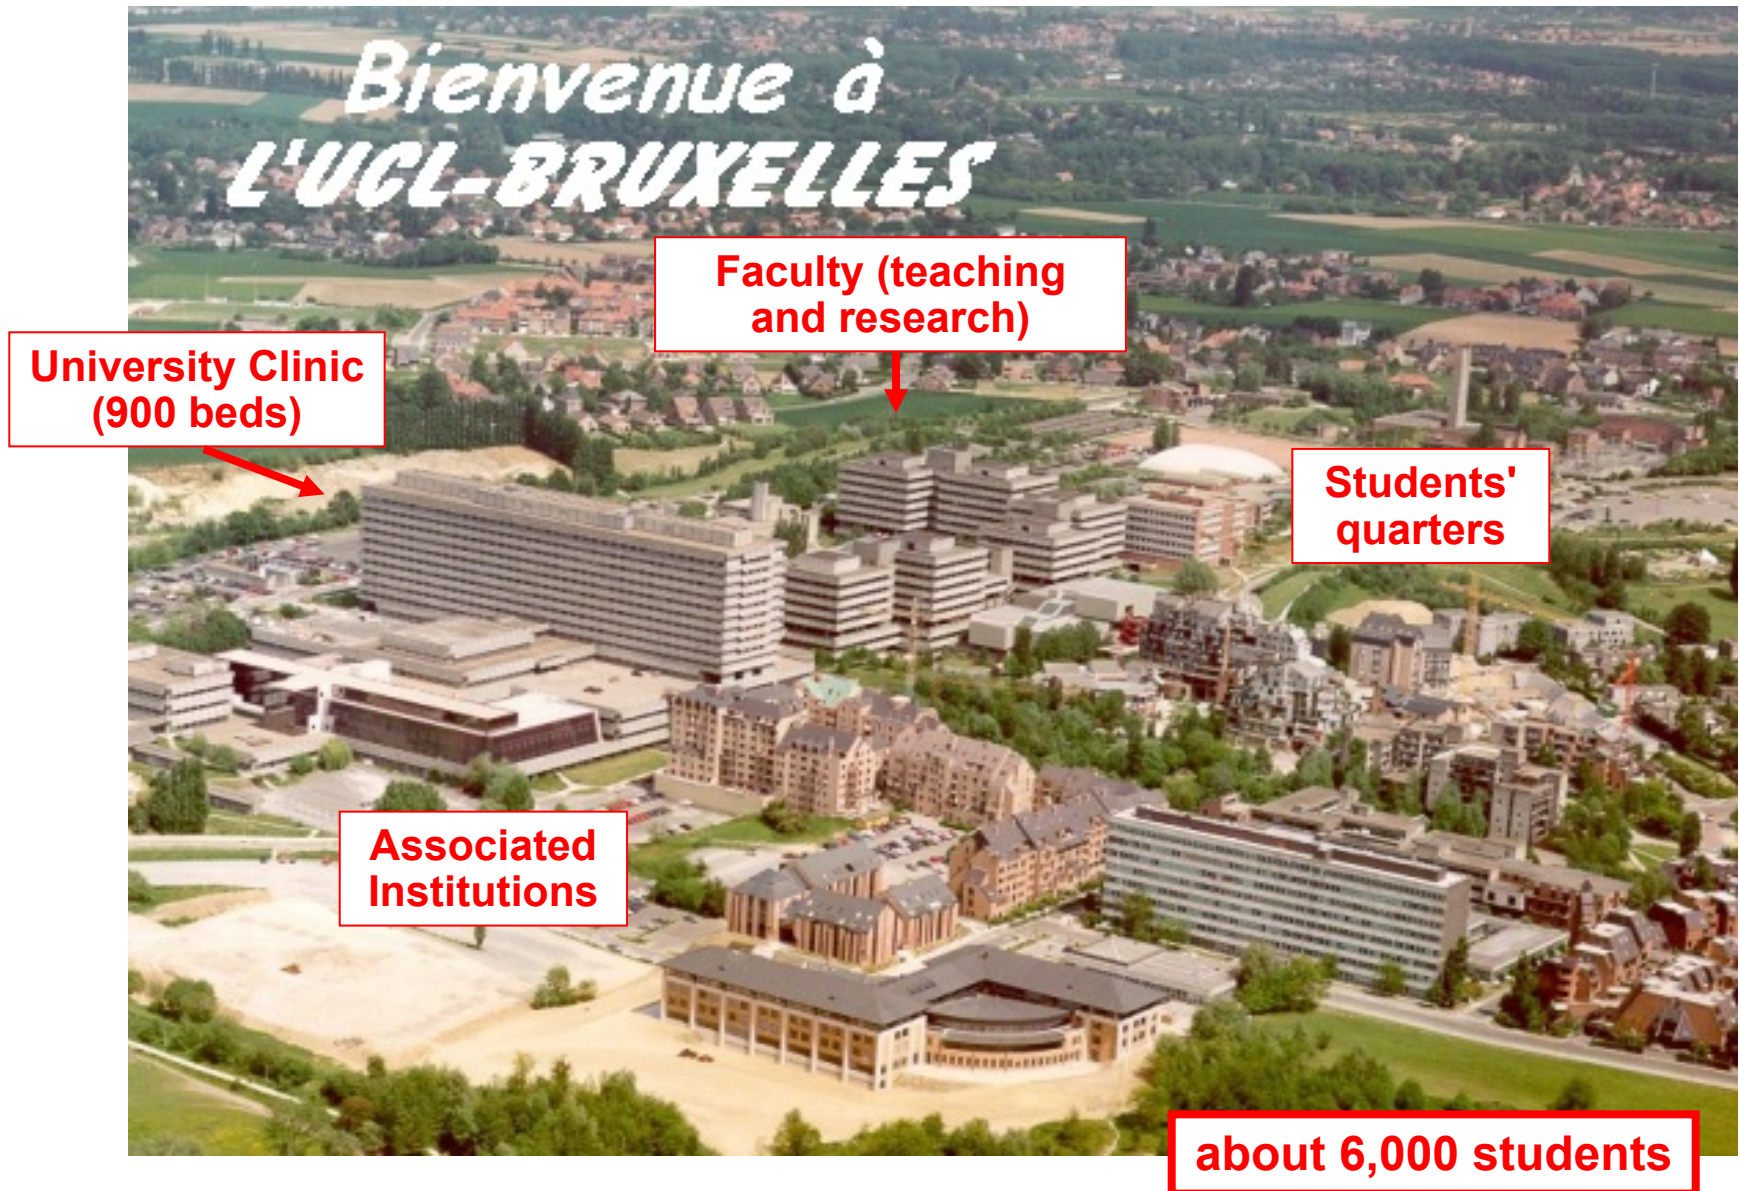

The distance between Universities is only 25 km...

- Together, the two Universities have about 55,000, which is  $\sim 2/5$  of all University population in Belgium ( $\sim 10^6$  inhabitants)

# Our campus in Brussels (Health Sciences)...

# **The antibiotic crisis \***

- \* A pictorial view using 4 paintings of Van Goch (who stayed briefly in Belgium when moving from Holand to France) and selected Belgian and International data

# Are antibiotics following a path to madness ?

discovery in soil bacteria and fungi

# Are antibiotics following a path to madness ?

and then we all saw the  
blooming tree of semi-  
synthetic and totally synthetic  
antibiotics

# Are antibiotics following a path to madness ?

and the General Surgeon told us  
that the fight was over

# Are antibiotics following a path to madness ?

**But...**

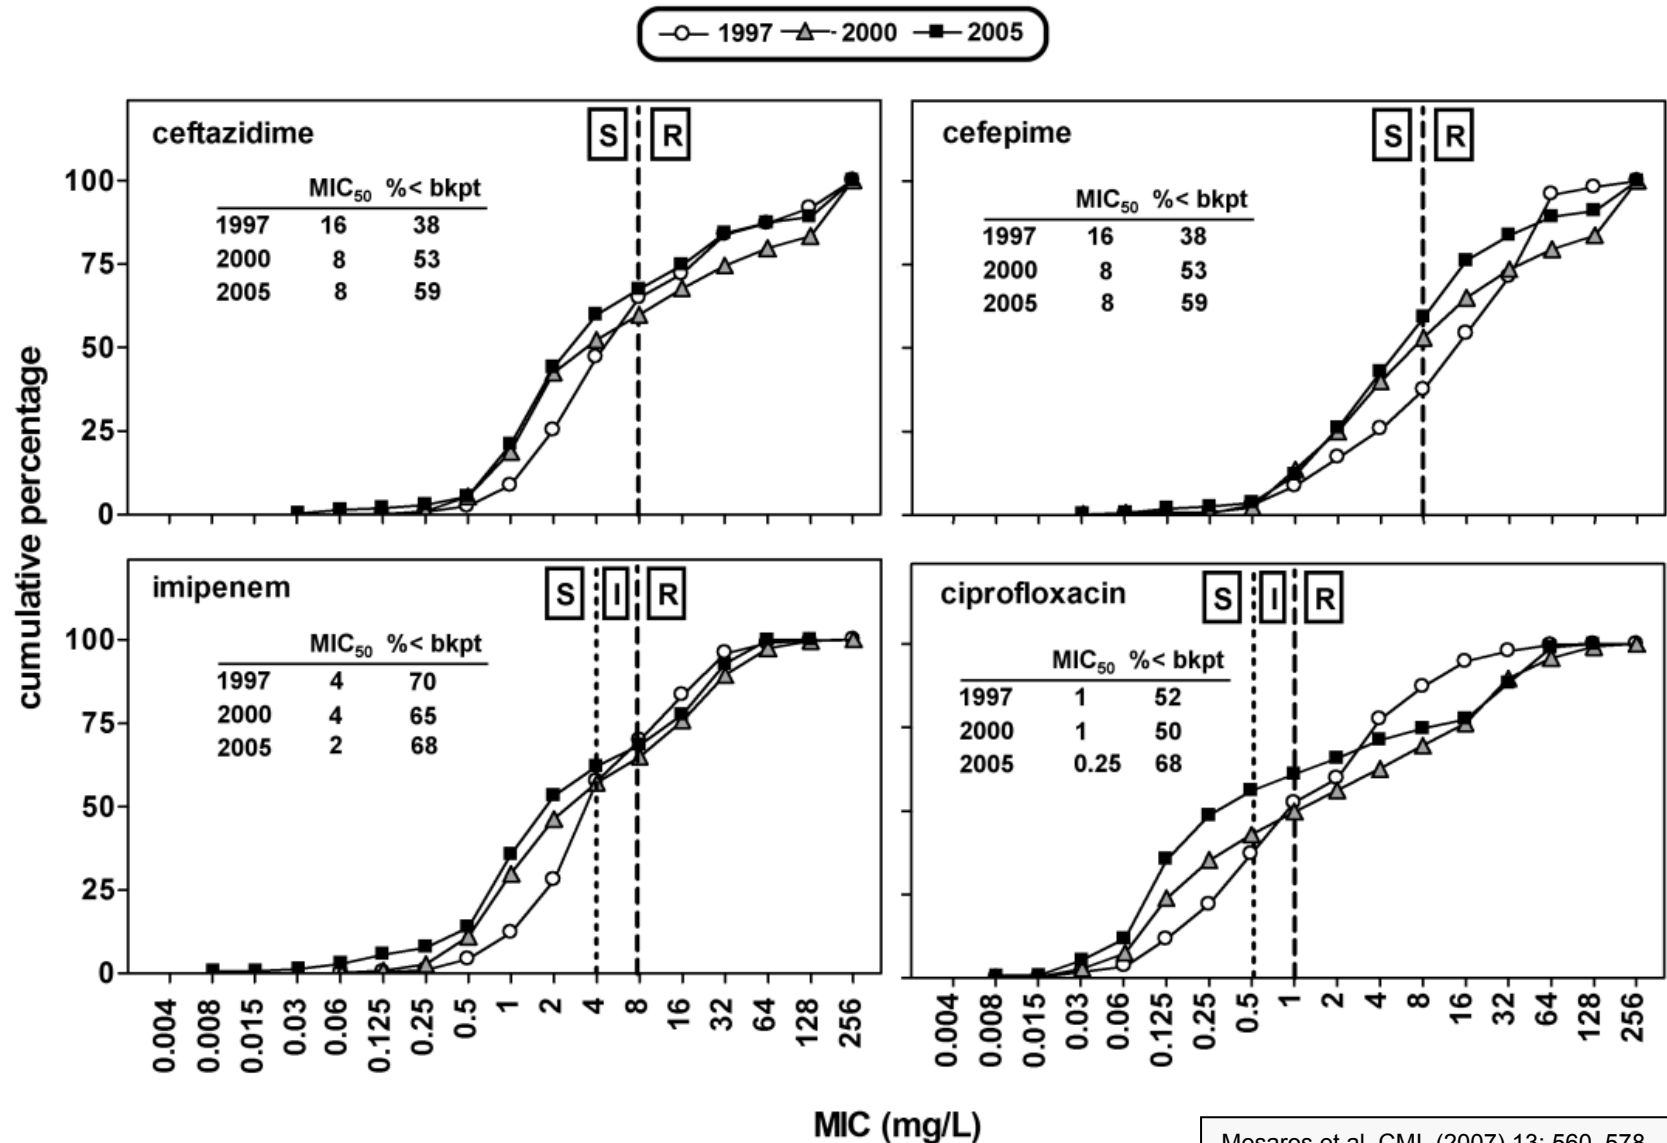

## Example #1: longitudinal studies with *S. pneumoniae*

### *S. pneumoniae*: evolution of resistance in Belgium from 1985 to 2000

# Example #2: Extent of resistance of *P. aeruginosa*

Mesaros et al. CMI, (2007) 13: 560–578

# Example #3 : the hidden risk of therapy

International Journal of Antimicrobial Agents 36 (2010) 513–522

Contents lists available at ScienceDirect

International Journal of Antimicrobial Agents

journal homepage: <http://www.elsevier.com/locate/ijantimicag>

In vivo development of antimicrobial resistance in *Pseudomonas aeruginosa* strains isolated from the lower respiratory tract of Intensive Care Unit patients with nosocomial pneumonia and receiving antipseudomonal therapy

Mickaël Riou<sup>a,1</sup>, Sylviane Carboneille<sup>a,2</sup>, Laëtitia Avrain<sup>a,b</sup>, Narcisa Mesaros<sup>a,3</sup>, Jean-Paul Pirnay<sup>c</sup>, Florence Bilocq<sup>c</sup>, Daniel De Vos<sup>c,d</sup>, Anne Simon<sup>e</sup>, Denis Piérard<sup>f</sup>, Frédérique Jacobs<sup>g</sup>, Anne Dediste<sup>h</sup>, Paul M. Tulkens<sup>a,\*</sup>, Françoise Van Bambeke<sup>a</sup>, Youri Glupczynski<sup>i</sup>

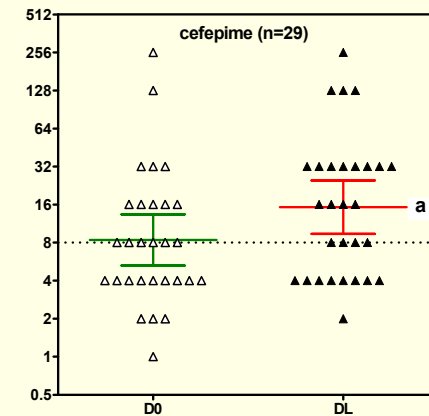

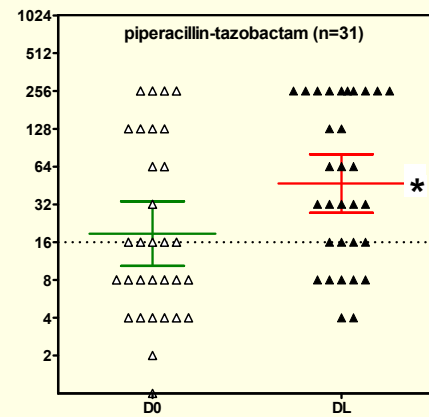

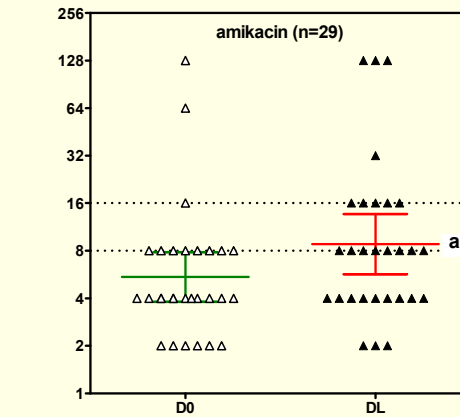

# What happens during treatment ?

- D0: initial isolate  
DL: last isolate obtained
- individual values with geometric mean (95 % CI)
- S (lowest line) and R (highest line) EUCAST breakpoints

\*  $p < 0.05$  by paired t-test (two-tailed) and Wilcoxon non-parametric test

<sup>a</sup>  $p < 0.05$  by Wilcoxon non-parametric test only

Note: stratification by time between D0 and DL gave no clue (too low numbers)

for all antibiotics, we see global increases in MIC

# Public Health Approaches

# Antibiotic consumption is highly variable between countries (for no good reason)

## Step 1 : knowing what you do

Cars et al., Lancet. 2001 Jun 9;357(9271):1851-3.

# Overuse is part of the problem ...

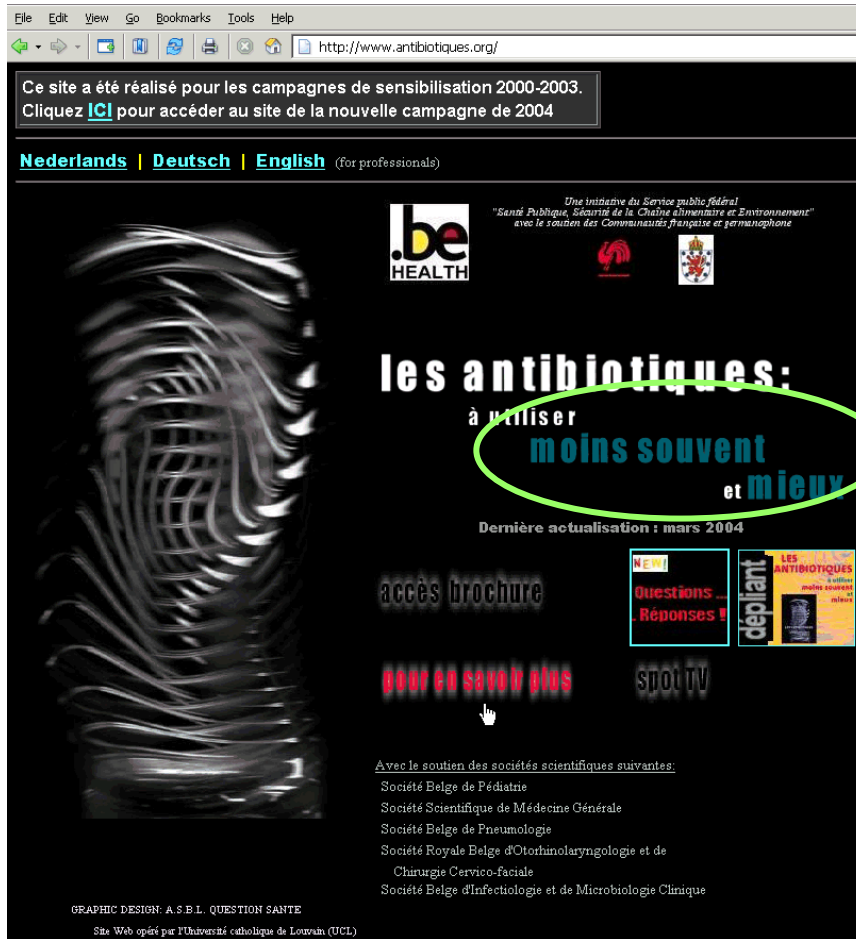

**Risk of resistance to  $\beta$ -lactams among invasive isolates of *Streptococcus pneumoniae* regressed against outpatient sales of beta-lactam antibiotics in 11 European countries**

- resistance data are from 1998 to 1999; antibiotic sales data 1997.
- DDD = defined daily doses

Bronzwaer SL, Cars O, et al. Emerg Infect Dis 2002 Mar;8(3):278-82

# Public campaigns in Belgium

## Step 2 : Informing and counseling

less...

# Public campaigns in Belgium

## Step 2 : Informing and counseling

and better ...

# Public campaigns in Belgium

## Step 3 : Monitoring usage

from Bauraind *et al.*, JAMA 2004;  
292:2468-70;  
more details on  
<http://www.antibiotiques.org/english/>

- significant reduction of AB prescriptions (sales = prescriptions in Belgium) during the influenza epidemic periods
- no significant-side effect detected
- cost-effective for public health

# What should public authorities do ?

- promote better and cheap diagnostic approaches
- support the collection of resistance data in the community and in the hospital
- support the setting of guidelines adapted to the reality of the country
- reinforce the role of the pharmacists and doctors-pharmacists relationships for quality of care and enforcement of guidelines
- decreasing the pressure on parents and family towards doctors for a "fast cure" in face of minor diseases (socio-economical factors)
- control Industry pressure (and find new economic structures)

**This is what I'm doing in Hanoi**  
**<http://www.facm.ucl.ac.be/advance-courses.htm>**

# **Actions based on knowledge of resistance / toxicity patterns**

# Resistance: mechanisms

It was six men of Hindustan  
To learning much inclined,  
Who went to see the Elephant  
(Though all of them were blind),  
That each by observation  
Might satisfy his mind

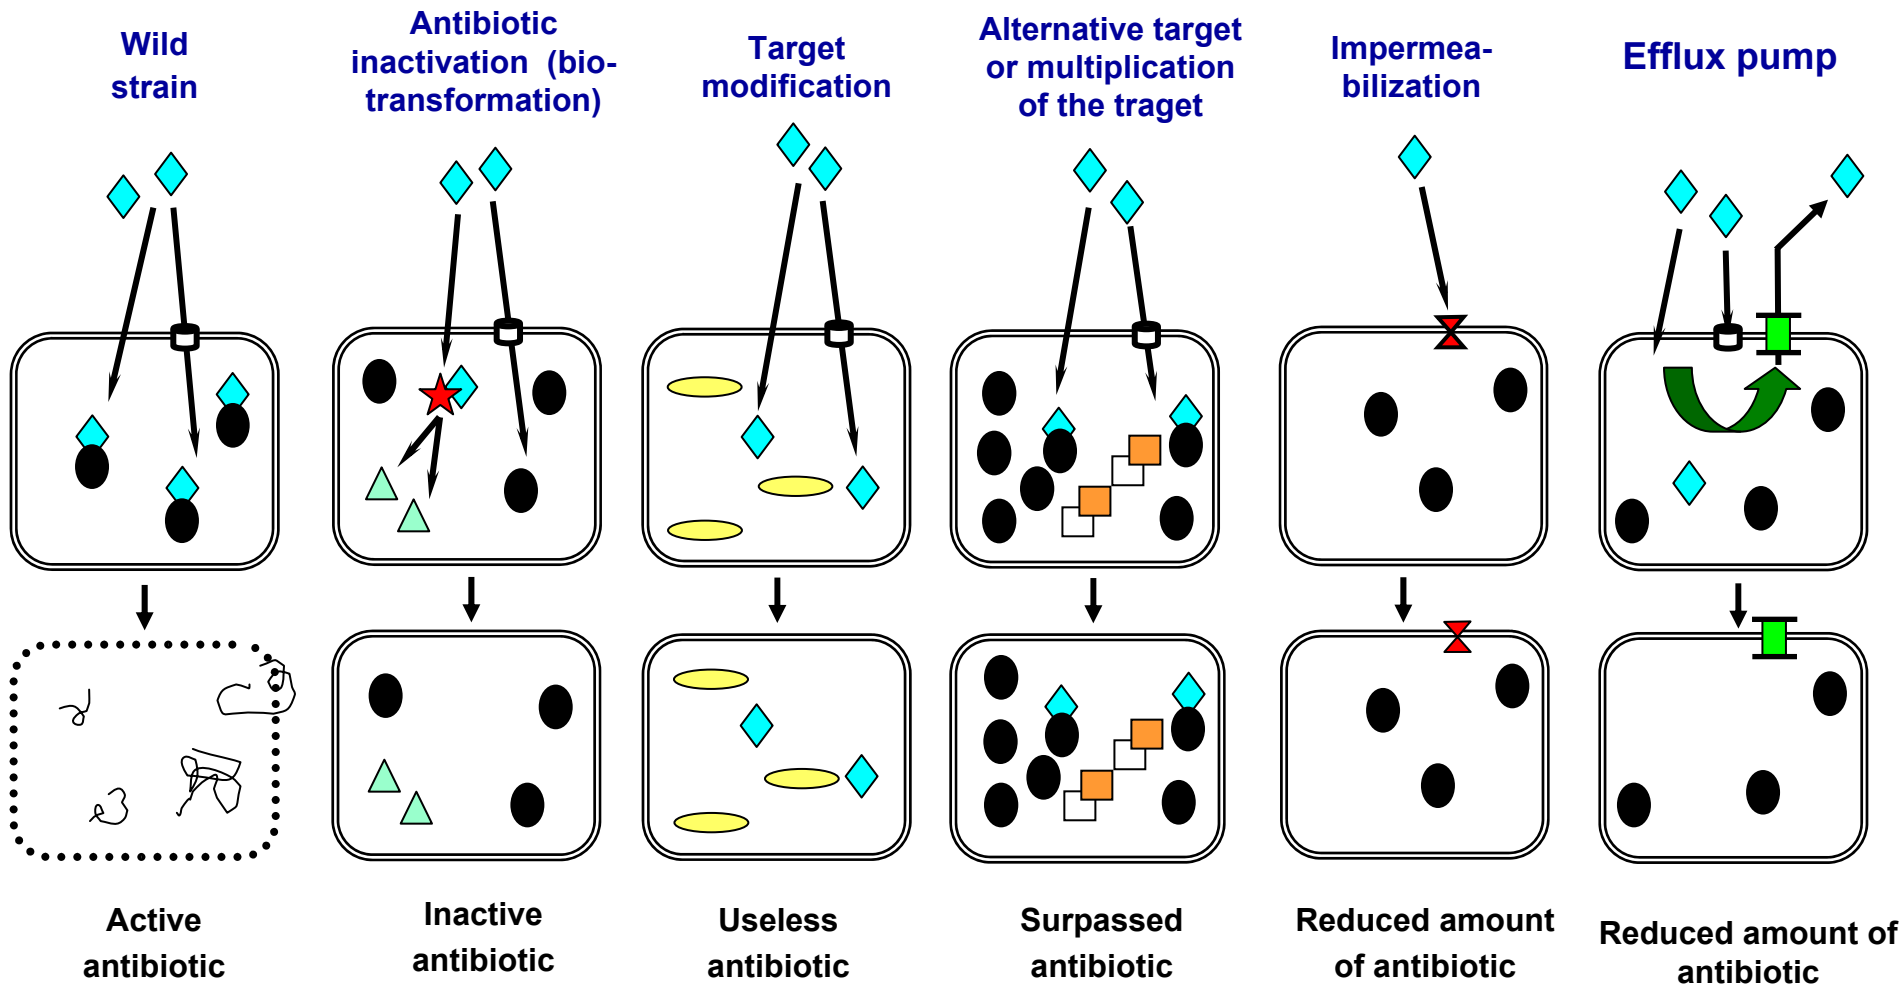

**They conclude that the elephant is like a wall, snake, spear, tree, fan or rope, depending upon where they touch.**

Sri Ramakrishna Paramahansa (February 18, 1836 - August 16, 1886), a famous mystic, used this parable to discourage dogmatism

**In Saxe's version, the conflict is never resolved.**

John Godfrey Saxe (June 2, 1816 – March 31, 1887), American poet, best known for his re-telling of the Indian parable "The blind men and the Elephant".

# Antibiotic resistance: short overview of main mechanisms

# Actually, triggering resistance is easy...

Exposure of *E. aerogenes* to anti-Gram (-) penicillin (temocillin) to 0.25 MIC for 14 days with daily readjustment of the concentration based on MIC détermination

### DD-Ligases as a Potential Target for Antibiotics: Past, Present and Future

I. Tytgat<sup>1</sup>, E. Colacino<sup>§,2</sup>, P.M. Tulkens<sup>1</sup>, J.H. Poupaert<sup>2</sup>, M. Prévost<sup>3</sup> and F. Van Bambeke<sup>\*,1</sup>

<sup>1</sup>Unité de Pharmacologie cellulaire et moléculaire, <sup>2</sup>Unité de Chimie pharmaceutique et radiopharmacie, Louvain Drug Research Institute, Université catholique de Louvain; <sup>3</sup>Structure et Fonction des Membranes Biologiques, Université Libre de Bruxelles, Brussels, Belgium

# Background

**D-Ala-D-X ligases act in the very early steps of peptidoglycan synthesis and are essential enzymes for bacterial growth**

# Rationale

- D-Ala-D-Ala ligases are essential enzymes
- This target has been only poorly explored
  - cycloserine: poor inhibitor and toxic)
  - Phosphinates: active on the enzyme but do not penetrate in the bacteria (too polar)
- Two approaches:
  - through conventional pharmacochemical approaches (modeling around know substrate)
  - de novo modeling from analysis of the protein conformation
  - BUT always using compounds that will enter the bacteria

# Inhibition of purified His-tagged D-Ala – D-Ala ligase by D-cycloserine \*

Literature data:

- 2 mM (Feng et al., AAC 2003;47:283-291)
- 0.8 mM (Park et al., PNAS 1997;94:10040-10044)

\* broad but weak antimicrobial activity (through inhibition of D-Ala-racemase and, to a lesser extent, D-Ala-D-Ala ligase); used as 2d/3d line drug against *M. tuberculosis* (MIC: 5-20 mg/L; 50-200  $\mu$ M); usage limited because of CNS toxicity

# First evaluation of molecules in the family of hydantoins (phamacochemical design starting from D-Ala-D-Ala)

**Hyd A**

2-[4-(2-Carboxy-ethyl)-2,5-dioxo-imidazolidin-1-yl]-ethyl-ammonium; chloride  
Mw : 251  
 $C_{14}H_{14}ClN_3O_4$

**Hyd B**

2-(4-Carboxymethyl-2,5-dioxo-imidazolidin-1-yl)-ethyl-ammonium chloride  
Mw : 237  
 $C_{12}H_{12}ClN_3O_4$

**Hyd C**

3-(1-Carboxymethyl-2,5-dioxo-imidazolidin-4-yl)-propyl-ammonium chloride  
Mw : 251  
 $C_{14}H_{14}ClN_3O_4$

**Hyd D**

2-[4-(2-Carboxy-ethyl)-2,5-dioxo-imidazolidin-1-yl]-ethyl-ammonium; chloride  
Mw : 251  
 $C_{14}H_{14}ClN_3O_4$

**Activity of Ddl in the presence of inhibitors  
(1.5 mM) with 5 min of preincubation**

# From hydantoines to Benzoxazoles

## Hydantoïnes (UCL)

n et m sont des chaînes alkyles de longueur variable

## Phosphinate analogues (UCL)

R<sub>1</sub> = H, CH<sub>3</sub>, Ph.

R<sub>2</sub> = H, CH<sub>3</sub>, Ph.

X = O, N, S, CH<sub>2</sub>, CF<sub>2</sub>.

## Benzoxazoles

(design de novo [Unité de Bioinformatique Génomique et Structurale, ULB])

- A) Groupe basique
- B) Groupe Hydrophile
- C) Groupe Hydrophobe

# Benzoxazoles

## CLAIMS

1. A compound of any of formulas (I-a), (II-a), (III-a), (IV-a) or (V-a):

(I-a)

(II-a)

(III-a)

(IV-a)

(V-a)

or a pharmaceutically acceptable *N*-oxide form, addition salt, prodrug or solvate thereof, for use in the treatment of a bacterial infection.

# Benzoxazoles

## Inhibition of D-Ala-D-Ala-ligase

# **Refurbishing old antibiotics: novel aminoglycosides \***

---

\* using proprietary data of Achaogen Inc., South San Francisco, Cal.

# Refurbishing aminoglycosides: the challenges and the advantages

- Advantages
  - wide spectrum and highly bactericidal
  - no metabolism and linear pharmacokinetics
  - extensive knowledge of their therapeutic and toxicological properties (leading to simple "once-daily dosing")
- Challenges
  - extensive development of resistance (mostly enzyme-mediated → aminoglycoside-modifying enzymes [AME])
  - nephrotoxicity and ototoxicity remain of concern and seem linked to activity

FIG. 3. Major aminoglycoside-modifying enzymes acting on kanamycin B (this aminoglycoside is susceptible to the largest number of enzymes). Each group of enzymes inactivates specific sites, but each of these sites can be acted upon by distinct isoenzymes (roman numerals) with different substrate specificities (phenotypic classification; each phenotype comprises several distinct gene products [denoted by lowercase letters after the roman numeral in the text]); at least one enzyme is bifunctional and affects both positions 2' (*O*-phosphorylation) and 6' (*N*-acetylation)). The main clinically used aminoglycosides on which these enzymes act are as follows: amikacin (A), dibekacin (Dbk), commercial gentamicin (G) (see text), gentamicin B (GmB), kanamycin A (K), isepamicin (I), netilmicin (N), sisomicin (S), and tobramycin (T) (see text for discussion of arbekacin, sagamicin, and dactimicin). The drug abbreviations which appear in parentheses are those for which resistance was detectable *in vitro* even though clinical resistance was not conferred. Based on the data of Shaw et al. (89).

MINIREVIEWS 1005

FIG. 1. Ultrastructural alterations induced in proximal tubular cells during aminoglycoside treatment. (A) Control. Changes detected early on and at low doses (B) consist mainly of the enlargement of lysosomes, which most likely occurs by fusion of preexisting structures and which is caused by the progressive deposition of polar lipids which adopt a concentric lamellar disposition (myelin-like structures, most commonly referred to as *myeloid bodies*); the other subcellular structures are usually well preserved. Later changes or changes observed with high doses (C) include the apparent rupture of lysosomes (with the release of myeloid bodies in the cytosol), extensive mitochondrial swelling and damage, dilatation of the endoplasmic reticulum cisternae, shedding of the apical brush-border villi, pericellular membrane discontinuities, and the occurrence of apoptotic nuclei. These alterations do not necessarily coexist in all cells. The figure is adapted from reference 76 and is based on the typical descriptions given in references 38, 40, 71, 76, 77, 127, and 138.

# Synthesis and Structure of the novel aminoglycoside ACHN-490

- ACHN-490 is a derivative of sisomycin (known to be highly active but toxic)
- The modifications made provide protection against most prevalent AMEs
- Equally active against gentamicin-S and gentamicin *Enterobacteriaceae* and *Staphylococci*
- Indications being considered include cUTI, HAP, cIAI, and blood stream infections

Aggen J, et al, ICAAC 2009 Poster F1-840

# In Vivo Efficacy of ACHN-490 against Enterobacteriaceae and MRSA

- Murine neutropenic thigh model
  - MRSA
  - Susceptible and MDR Enterobacteriaceae
    - *E. coli* (+/- KPC)
    - *K. pneumoniae* (wt, + KPC, CIP-R/GEN-R)
    - *S. marcescens* (+KPC)
- ED<sub>50</sub> and ED<sub>50</sub>/MIC values lower for ACHN-490 compared to gentamicin
  - Gentamicin ineffective against GEN-R strains
- Bacterial titers reduced to or below the initial bacterial load (static level) for each strain
- Confirmatory of in vitro susceptibilities

Activity against KPC-expressing *K. pneumoniae* AKPN1109 in the murine neutropenic thigh model  
All mice dosed SC twice daily at 2 and 14 hours

MIC (μg/mL)  
 ACHN-490 = 0.5  
 Cipro = 2  
 Gent = 64  
 Imi = 32

# **Novel polymyxins**

# Why novel polymyxins ?

- Colistin (Polymyxin E; discovered in 1949 and without clinical use for long) has now become the "last resource" antibiotics in the treatment of infections caused by multi-resistant organisms...

[Colistin: the revival of polymyxins for the management of multidrug-resistant gram-negative bacterial infections.](#)

Falagas ME, Kasiakou SK.

Clin Infect Dis. 2005 May 1;40(9):1333-41. Epub 2005 Mar 22. Review. Erratum in: Clin Infect Dis. 2006 Jun 15;42(12):1819. Dosage error in article text.

PMID: 15825037 [PubMed - indexed for MEDLINE] **Free Article**

[Related citations](#)

- But colistin is a fairly toxic antibiotic (nephrotoxicity), which limits the concentrations that can be safely used, and therefore, limits its activity).
- Polmyxin B is more active but more toxic ...
- Better compounds are badly needed, but the mode of action of colistin (membrane permabilization) should be retained because it ensures a fast bactericidal effect AND synergy with other antibiotics

# Colistin Microbiology: morphological aspects

# Polymyxins synergy: the rationale (1 of 3)

- Gram-negative bacteria have two membranes (OM and IM)
- Antibiotic targets are most often located in the IM or intracellularly
- Most antibiotics must at least pass across the OM to reach their target, which may represent a limiting step

# Polymyxins synergy: the rationale (2 of 3)

- Gram-negative bacteria have also efflux systems defeating the passage of drugs across the OM and explaining the low activity of many antibiotics (intrinsic resistance) and the so-called "adaptative" resistance (aminglycosides)

# Polymyxins synergy: the rationale (3 of 3)

- Disrupting the OM (as colistin does) will facilitate access of the other antibiotics to their targets
- This may apply **EVEN** to antibiotics for which the bacteria are resistant (if due to OM impermeability/efflux phenomenon)

# Novel polymyxin B derivatives

|             |         |                   |      |                     |         |                   |                     |      |                   |                   |       |
|-------------|---------|-------------------|------|---------------------|---------|-------------------|---------------------|------|-------------------|-------------------|-------|
| Polymyxin B | MHA/MOA | -Dab <sup>+</sup> | -Thr | -Dab <sup>+</sup>   | -cy[Dab | -Dab <sup>+</sup> | -D <sup>+</sup> Phe | -Leu | -Dab <sup>+</sup> | -Dab <sup>+</sup> | -Thr] |
| NAB739      | OA      | -                 | -Thr | -D <sup>+</sup> Ser | -cy[Dab | -Dab <sup>+</sup> | -D <sup>+</sup> Phe | -Leu | -Dab <sup>+</sup> | -Dab <sup>+</sup> | -Thr] |
| NAB7061     | OA      | -                 | -Thr | -Abu                | -cy[Dab | -Dab <sup>+</sup> | -D <sup>+</sup> Phe | -Leu | -Dab <sup>+</sup> | -Dab <sup>+</sup> | -Thr] |
| NAB741      | Ac      | -                 | -Thr | -D <sup>+</sup> Ser | -cy[Dab | -Dab <sup>+</sup> | -D <sup>+</sup> Phe | -Leu | -Dab <sup>+</sup> | -Dab <sup>+</sup> | -Thr] |

- The MIC<sub>90</sub> of NAB739 for *E. coli* and Enterobacteriaceae are similar to those of polymyxin B (1-2 mg/L).
- NAB739 is also active against *Acinetobacter baumannii*, and *Pseudomonas aeruginosa*.
- NAB7061 and NAB741 strongly synergize the activity of antibiotics (including rifampicin, macrolides, fusidic acid and vancomycin) towards Gram (-) pathogens

## Temocillin revived

David M. Livermore<sup>1\*</sup> and Paul M. Tulkens<sup>2</sup>

<sup>1</sup>*Antibiotic Resistance Monitoring and Reference Laboratory, Health Protection Agency Centre for Infections, 61 Colindale Avenue, London NW9 5EQ, UK;* <sup>2</sup>*Unité de Pharmacologie Cellulaire et Moléculaire & Centre de Pharmacie Clinique, Université Catholique de Louvain, Bruxelles, Belgium*

Resistance in Gram-negative pathogens is an increasing concern, with carbapenems often appearing as the only acceptable treatment option in serious infections. Reviving older compounds that have fallen into disuse may help to alleviate this burden. Temocillin (6- $\alpha$ -methoxy-ticarcillin) is resistant to most if not all classical and extended-spectrum  $\beta$ -lactamases and to AmpC enzymes. It is also chemically stable, allowing administration by continuous infusion. Pharmacokinetic/pharmacodynamic analysis, aided by Monte-Carlo simulations, suggests a breakpoint of 8 mg/L for the registered maximum dosage of 4 g daily. Temocillin's weaknesses, explaining its limited previous use, are a lack of activity against Gram-positive organisms, anaerobes and *Pseudomonas*. In settings where these are unlikely or are covered by other agents, temocillin may be useful, potentially 'sparing' carbapenems and having little apparent potential to select for *Clostridium difficile*.

# Temocillin in a nutshell

(a)

ticarcillin

(b)

temocillin

Structural formulae of ticarcillin and temocillin emphasizing the importance of the  $\alpha$ -methoxy group (arrow) in temocillin for blocking access of water (W1) to the active serine (S70) of  $\beta$ -lactamase, thereby blocking the chain of molecular events leading to hydrolysis of the  $\beta$ -lactam ring (and inactivation of the antibiotic) and regeneration of an active enzyme.<sup>10</sup> (Matagne *et al.* 1993 *Biochem J* 1993; 293:607-11)

# Temocillin is also very thermostable

- Definition: > 90% intact product (Pharmacopeia)
- Conditions: mimicking the total daily dose (commercial product) in 48 mL (motor operated syringe) water without pH adjustment and maintained at a fixed temperature (\*)

<sup>a</sup> Real-time PCR (threshold ratio compared to PAO1; values of  $\geq 2$  and 5 are considered to denote highly significant overexpression of *mexAB* and *mexXY*, respectively). <sup>b</sup> RT-PCR (qualitative detection [+/-]). <sup>c</sup> Phe-Arg- $\beta$ -naphthylamide (broad spectrum efflux inhibitor) used at 50 mg/L. <sup>d</sup> Isolated from Intensive Care patients with a clinical diagnostic of health care-associated pneumonia. <sup>e</sup> complete absence of detection. <sup>f</sup> No growth, PA $\beta$ N MIC = 25 mg/L.

# Efflux and resistance

- efflux is a universal mechanism for cell protection against "toxic" membrane-diffusing agents
- many drugs diffuse through membranes because we made them amphiphilic to favor their diffusibility ...and become opportunistic substrates for efflux pumps
- for AB, efflux decreases the amount of drug in bacteria and impairs activity, increasing the MIC ...
- insufficient drug exposure favors the selection of less sensitive organisms

ATP Binding in SAV1866

*J. Phys. Chem. B*, Vol. 114, No. 48, 2010 15949

**Figure 1.** Ribbon representation depicting the crystal structure of the SAV1866 dimer (PDB code: 2ONJ). One monomer is green, the second monomer is white. The ATP molecules located in the NBDs are represented as sticks and are colored according to the atom represented (carbon in cyan, nitrogen in blue, oxygen in red, and phosphorus in bronze). ECL and CH stand for the extracellular loops and the intracellular coupling helices. The enlarged view shows a close-up illustration of one of the NBDs and of the main motifs common to members of the ABC exporter family.

# Structure-based approach: the substrate trajectory

**Figure 3.** Dynamics of the internal TMD chamber in the nucleotide-free and the nucleotide-bound trajectories. Access paths originating at the bottom center of the TMD identified with the MOLE program<sup>57</sup> at 0, 40, and 80 ns of the simulation time. Upper: In the nucleotide-free trajectory. (A) At 0 ns a central path is identified that eventually splits at its extracellular extremity. (B) At 40 ns a central path persists, albeit with a much smaller radius. (C) At 80 ns, no central cavity exiting to the extracellular medium is identified anymore. Other, narrower paths exit to the cytosol and inner membrane leaflet. Lower: In the nucleotide-bound trajectory. (D) and (E) At 40 and 80 ns a central tunnel is observed. The 0 ns conformation is not shown as it is identical to that in the nucleotide-bound trajectory.

# Fluroquinolones: some of the challenges

- Activity against resistant strains
  - if target mutations: get lower MIC (to cope for 1 or 2 mutations)
  - if efflux: modify stucture to avoid recognitoin by efflux transporters

Fig. 4. Cross-resistance and dissociated resistance in quinolones.  $Q_A$  and  $Q_B$  illustrate a situation of cross-resistance: although the initial susceptibility of the strain may be different for molecules A and B, mutations in the target enzymes lead to similar changes in the susceptibility to both drugs.  $Q_C$  illustrates a situation of dissociated resistance: the susceptibility to molecule C does not change in spite of the acquisition of a first mutation, and will increase only upon acquisition of a second mutation.

<sup>a</sup> *S. aureus* isogenic strain of SA1 (originally ATCC 25923)

<sup>b</sup> *S. aureus* overexpressing NorA (from C. Quentin  
(University Victor Segalen Bordeaux, France [57-Ba et al. 2006])

# Finafloxacin: why more active at acid pH...

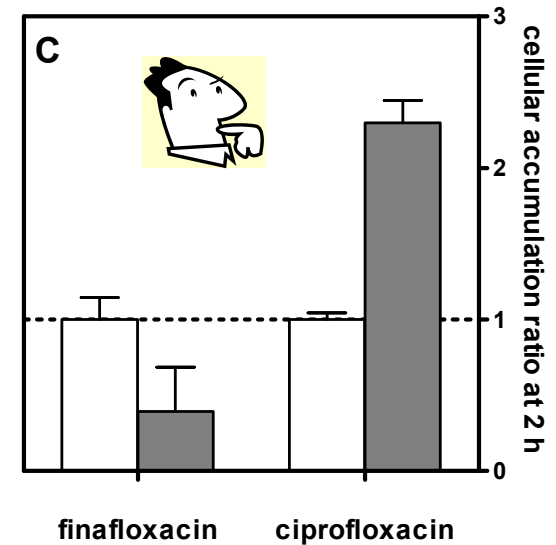

# Finafloxacin: what about acumulation in cells ?

**Kinetics of uptake  
at pH 7**

**2 h accumulation at  
different pH**

**Effect of NH<sub>4</sub>Cl  
(neutralizes lysosomes)**

# Finafloxacin: what about intracellular *S. aureus* ?

You gain in  
potency

You loose in potency  
and maximal activity

Vallet et al. Int. J. Antimicrob. Agents 2011; 38:249– 256

## Other fluoroquinolones with enhanced acid pH activity

ciprofloxacin

nadifloxacin

finafloxacin

delafloxacin

# Delafloxacin

FIG. 1. Structural formula and physicochemical properties of moxifloxacin and delafloxacin. The open arrows point to the acidic function of fluoroquinolones and the plain arrow to the basic function of moxifloxacin, which is protonated at physiological pH. The table shows the calculated pK<sub>a</sub>s, log P (partition coefficient), and log D (distribution coefficient) at neutral pH together with the ratio of species in solution at neutral and acidic pHs. In columns labeled with a superscript a, sources of values are as follows. pK<sub>a</sub>s, reference 22 for moxifloxacin; data are on file from Abbott Laboratories for delafloxacin. Log P and log D, Scifinder Scholar software program, version 2007. Values in the column labeled with a superscript b were calculated as follows. Moxifloxacin, % fully protonated form (<sup>+</sup>H<sub>2</sub>N...COOH) = 100/(1 + 10<sup>pH - pK<sub>a1</sub></sup> + 10<sup>2·pH - pK<sub>a1</sub> - pK<sub>a2</sub></sup>); % zwitterion (<sup>+</sup>H<sub>2</sub>N...COO<sup>-</sup>) = 100/(1 + 10<sup>pK<sub>a1</sub> - pH</sup> + 10<sup>pH - pK<sub>a2</sub></sup>); % fully deprotonated form (HN...COO<sup>-</sup>) = 100 - % (<sup>+</sup>H<sub>2</sub>N...COO<sup>-</sup>) - % (<sup>+</sup>H<sub>2</sub>N...COOH). Delafloxacin, % uncharged form (N...COOH) = 100/(1 + 10<sup>pH - pK<sub>a1</sub></sup>); % deprotonated form (N...COO<sup>-</sup>) = 100 - % (N...COOH). Each value in bold is the most abundant form for each drug at the considered pH.

# Delafloxacin

FIG. 2. Comparative susceptibilities of various *S. aureus* isolates to moxifloxacin (circles) or delafloxacin (squares). MICs were measured at pH 7.4, and strains are ranked based on their susceptibility to moxifloxacin. Resistance phenotypes and/or strain source are designated by lowercase letters along the x axis: a, animal MRSA; c, CA-MRSA; e, efflux (NorA); h, HA-MRSA; l, linezolid-resistant; m, characterized mutations in fluoroquinolone targets; s, MSSA.

# Delafloxacin and activity at acid pH

FIG. 3. Accumulation in *S. aureus* ATCC 25923 (left) or MIC (right) of fluoroquinolones in broth at different pHs. Left: growing bacteria were incubated for 30 min in pH-adjusted broth with delafloxacin (100 mg/liter) or moxifloxacin (50 mg/liter). Values are expressed as the cellular-to-extracellular concentration ratio and are shown as means  $\pm$  SD for three independent samples. The dotted line shows the value measured for both drugs at pH 7.4. For statistical analysis, data with asterisks are significantly different from those for controls (pH 7.4;  $P < 0.01$ ), as determined by one-way analysis of variance (ANOVA) (Dunnnett multiple-comparison test). Right: MICs of delafloxacin and moxifloxacin (expressed as the change [in log<sub>2</sub> units] from the MIC determined at pH 7.4) in pH-adjusted broth. Values are means for three independent samples (yielding 3 identical values).

## Other examples...

- forcing the opening of PBP2a  
→ recover activity against MRSA
