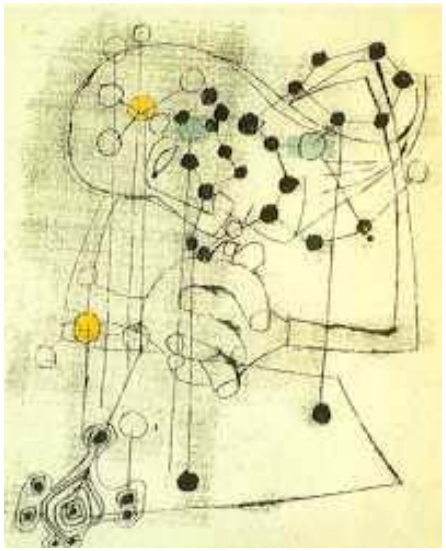
The approach in a nutshell

pharmacodynamics

pharmacokinetics

antibiotic toxicity

resistance



novel bacterial targets

clinical applications

antibiotics: from molecules to man

What will it be all about ?

- **The antibiotic crisis …**
  - are antibiotics following a **path of madness** ?
    (the reality in hospitals and in the community…)
  - the **"resistome"** (or why do we will always have resistance…)
  - the "**selectome**" (or why do we favor emergence of resistance)
  - the "**connectome"** (or why we loose several antibiotics at the same time)

- **The main lines of action** (for research)
  - the **7 pillars of wisdom ?**

- **Laboratory and translational studies at LDRI** (examples)
  - poorly exploited targets (D-Ala-D-Ala ligase)
  - refurbishing old antibiotics (aminogycosides, polymyxins, temocillin)
  - better antibiotic use (PK/PD, intracellular bacteria
  - PK/PD approaches to mitigate the emergence of resistance (β-lactams and fluoroquinolones)

Are antibiotics following a path to madness ?

NDM-1-Producing *Klebsiella pneumoniae* Resistant to Colistin in a French Community Patient without History of Foreign Travel

Corinne Arpin,[a] Patrick Noury,[b] Delphine Boraud,[b] Laure Coulange,[a] Alain Manetti,[c] Catherine André,[a] Fatima M'Zali,[a] and Claudine Quentin[a]

Université de Bordeaux, Microbiologie Fondamentale et Pathogénicité UMR 5234, Bordeaux, France[a]; Laboratoire de Biologie Médicale EXALAB, Site de Villenave d'Ornon, Villenave d'Ornon, France[b]; and Agence Régionale de Santé, Espace Rodesse, Bordeaux,[c] France

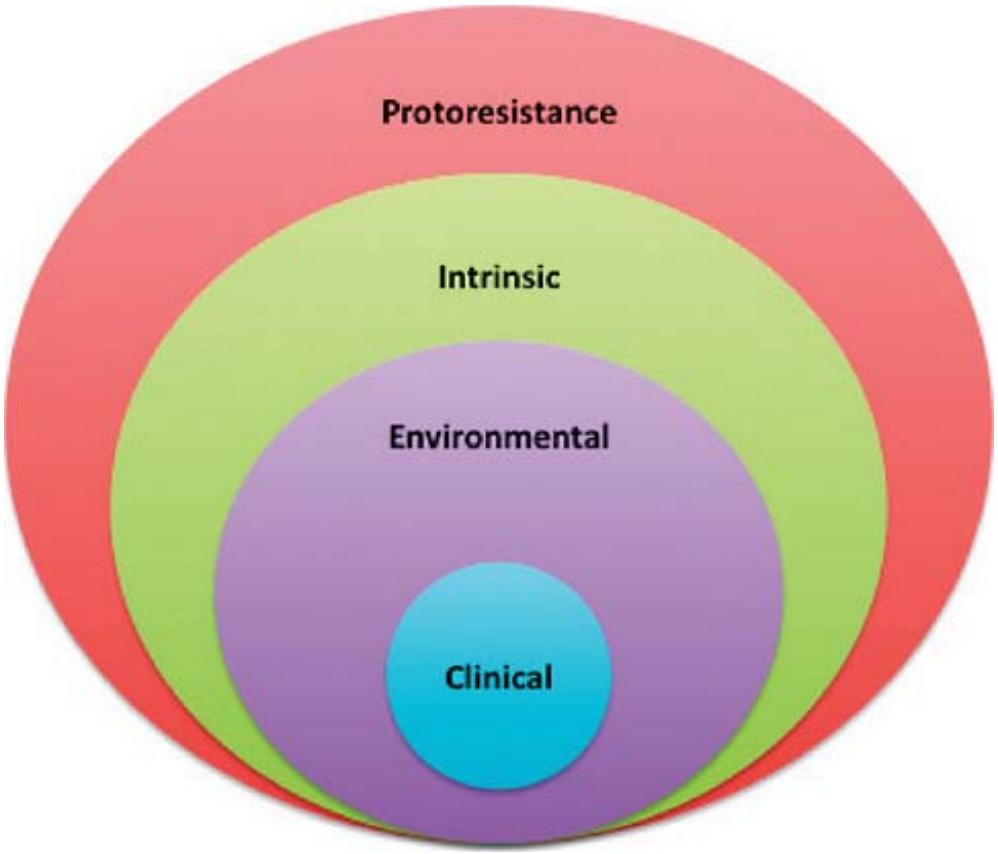
A carbapenem-resistant *Klebsiella pneumoniae* strain, Kp5196, was responsible for an uncomplicated cystitis in a patient living at home and without history of foreign travel. This isolate produced the metallocarbapenemase NDM-1 and was resistant to all antibiotics except tetracyclines and colistin. The *K. pneumoniae* strain belonged to sequence type ST15, and *bla*$_{NDM-1}$ was carried by a nontypeable conjugative plasmid. Two months later, a similar ST15 isolate, Kp5241, was present in the patient but was additionally colistin resistant.

The resistome …

- Resistance emergence is a natural process that has gone on for time immemorial.
  - **Example:** Parts of the operon mediating **vancomycin resistance** have been found in the permafrost layer, demonstrating the ancient nature of the problem…
    (many other examples of “resistance” in pre-antibiotic era)
  - **Significance:** resistance was with us since ever and we will never get rid of it …

- Horizontal gene transfer has long been considered as the main mechanism by which the resistome has been built over years
  - β-actamases, MRSA (PBP2a), Penicillin-resistant *S. pneumoniae* (mosaic genes),aminoglycoside-inactivating enzymes, QnR (fluoroquinolones-target protecting protein) …

The resistome …



The antibiotic resistome.

- all the genes and their products that contribute to antibiotic resistance.
- highly redundant and interlocked system
- clinical resistance under represents the resistance capacity of bacteria.
- existing biochemical mechanisms (protoresistome) serve as a deep reservoir of precursors that can be co-opted and evolved to

Antibiotic Resistance:Implications for Global Health and Novel Intervention Strategies: Workshop Summary
http://www.nap.edu/openbook.php?record_id=12925

Clinical resistance: the tip of the iceberg ?

- **“Clinical” resistance genes** are found on **pathogenic bacteria**. These are the fewest but also the most problematic ones at present.
- “**Father resistance genes**” found on antibiotic producers. (microorganisms that naturally produce antibiotics have their own protection mechanisms to avoid the adverse effects of the antibiotics on themselves).
  - ➢**These genes are a strong source for the pathogenic bacteria.**
- **Cryptic resistance genes**.
  (genes are embedded in the bacterial chromosome that may be overexpressed when “needed”)
- **Precursor genes**.
  (encode proteins with basal level activity against antibiotics but may evolve to a “full resistance genes” given the appropriate selection pressure.

"Father resistance genes": an original example with aminoglycosides

Proc. Nat. Acad. Sci. USA

Aminoglycoside Antibiotic-Inactivating Enzymes in Actinomycetes Similar to Those Present in Clinical Isolates of Antibiotic-Resistant Bacteria

(streptomyces/origin of R-factors/gentamicin-acetate)

RAOUL BENVENISTE* AND JULIAN DAVIES†

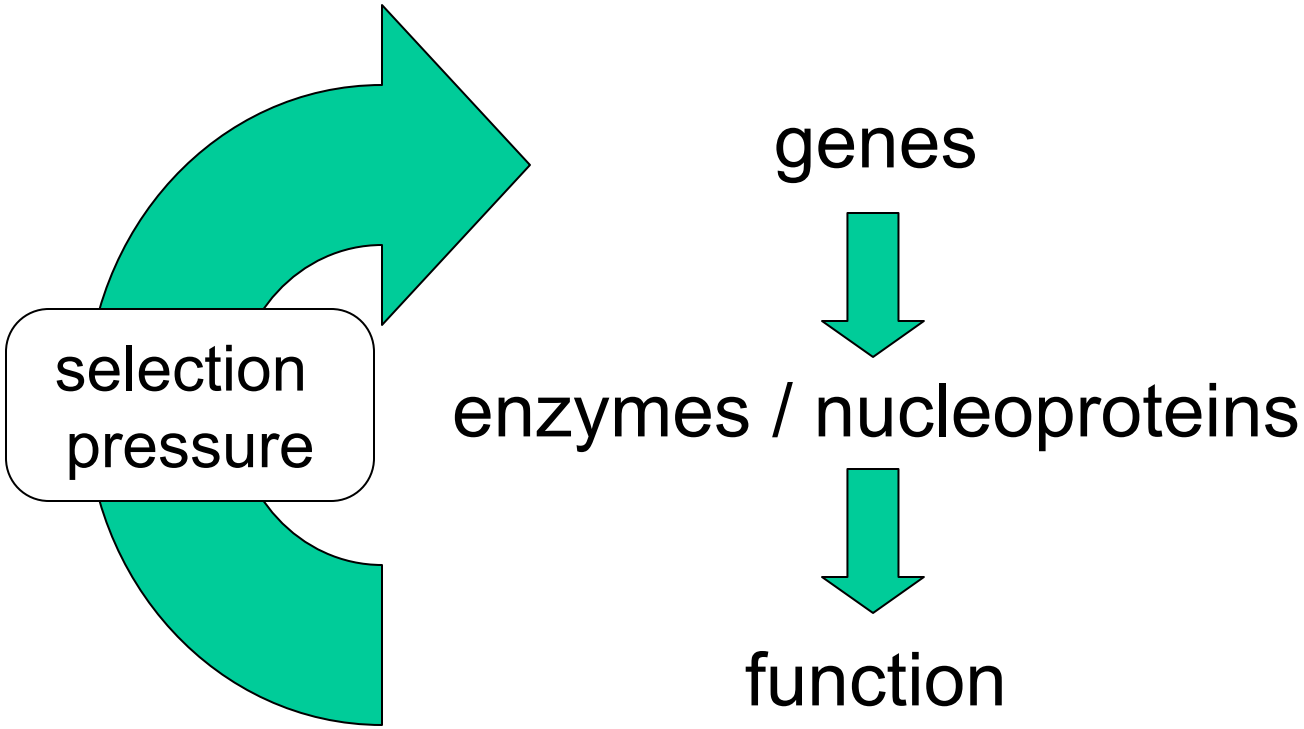
Department of Biochemistry, College of Agricultural and Life Sciences, University of Wisconsin—Madison, Madison, Wis. 53706

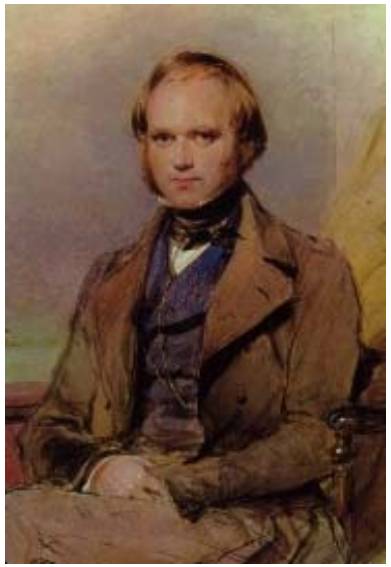
Communicated by Henry Lardy, May 11, 1973

One of the most striking properties of the actinomycetes is the extent to which they produce antibiotics; most of the aminoglycoside antibiotics (streptomycin, neomycin, kanamycin, gentamicin, tobramycin, and lividomycin) are produced by them.

The selectome

A simple application of Darwin's principles ...



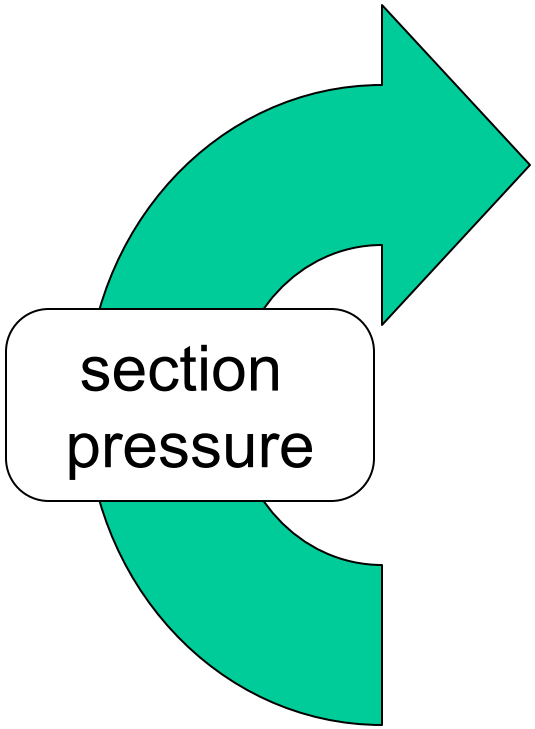


Detail of watercolor by
George Richmond, 1840.
Darwin Museum at Down House

How and why can you select so easily ?

A simple application of Darwin's principle…

to a highly plastic material…



- an infectious focus typicaly contains more than 10^6 - 10^9 organisms
- most bacteria multiply VERY quickly (20 min…) and do mistake …
- they are not innocent or useless mistakes

fast selection of the fitest !

The hidden risk of therapy (in our hospitals …)

7 pillars of wisdom ?

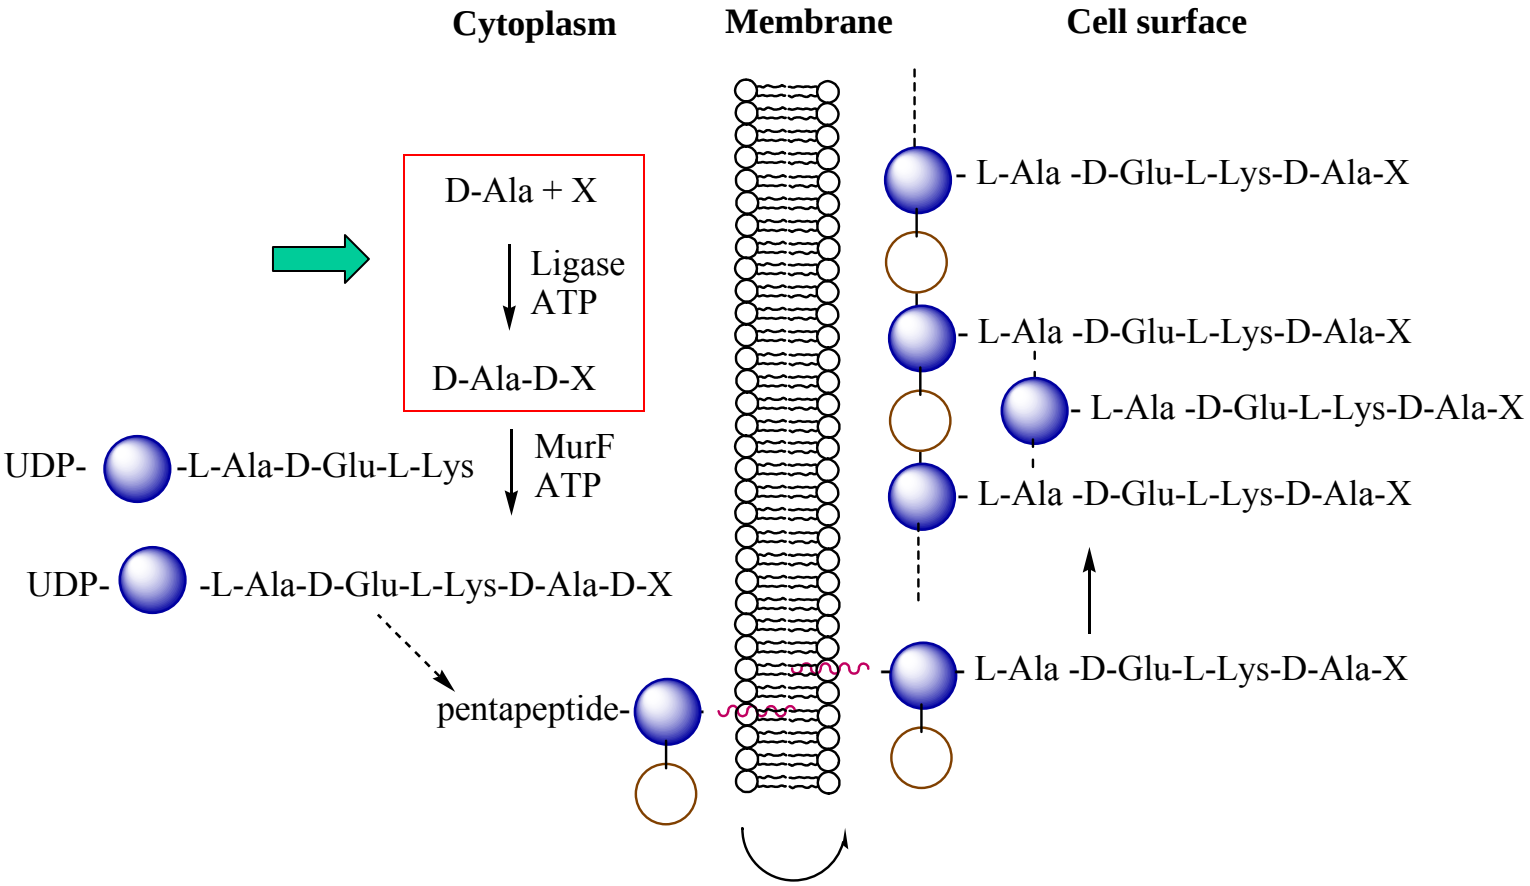
1. Public education
2. Public health, sanitation and quality of life
3. New antibiotics → new / poorly exploited targets
4. Old antibiotics
5. Better antibiotic use
6. Alternatives to antibiotics
7. Collaborative approach

Bush et al. Nature Reviews Microbiology 9, 894-896 (December 2011)

Poorly exploited targets: D-Ala-D-Ala ligase

D-Ala-D-X ligases

- **act in the very early steps of peptidoglycan synthesis**
- **are essential enzymes for bacterial growth**



Rationale for a valid target …

- D-Ala-D-Ala ligases are essential enzymes
- This target has been only poorly explored
  - cycloserine: poor inhibitor and toxic)
  - Phosphinates: active on the enzyme but do not penetrate in the bacteria (too polar)
- Two approaches:
  - through conventional pharmacochemical approaches (modeling around know substrate)
  - de novo modeling from analysis of the protein conformation
  - BUT always using compounds that will enter the bacteria

Benzoxazoles

Novel aminoglycosides *

- Advantages
  - wide spectrum and highly bactericidal
  - no metabolism and linear pharmacokinetics
  - extensive knowledge of their therapeutic and toxicological properties (leading to simple "once-daily dosing")

- Challenges
  - extensive development of resistance (mostly enzyme-mediated → aminoglycoside-modifying enzymes [AME])
  - nephrotoxicity and ototoxicity remain of concern and seem linked to activity

* using proprietary data of Achaogen Inc., South San Francisco, Cal. and example of collaborative approach

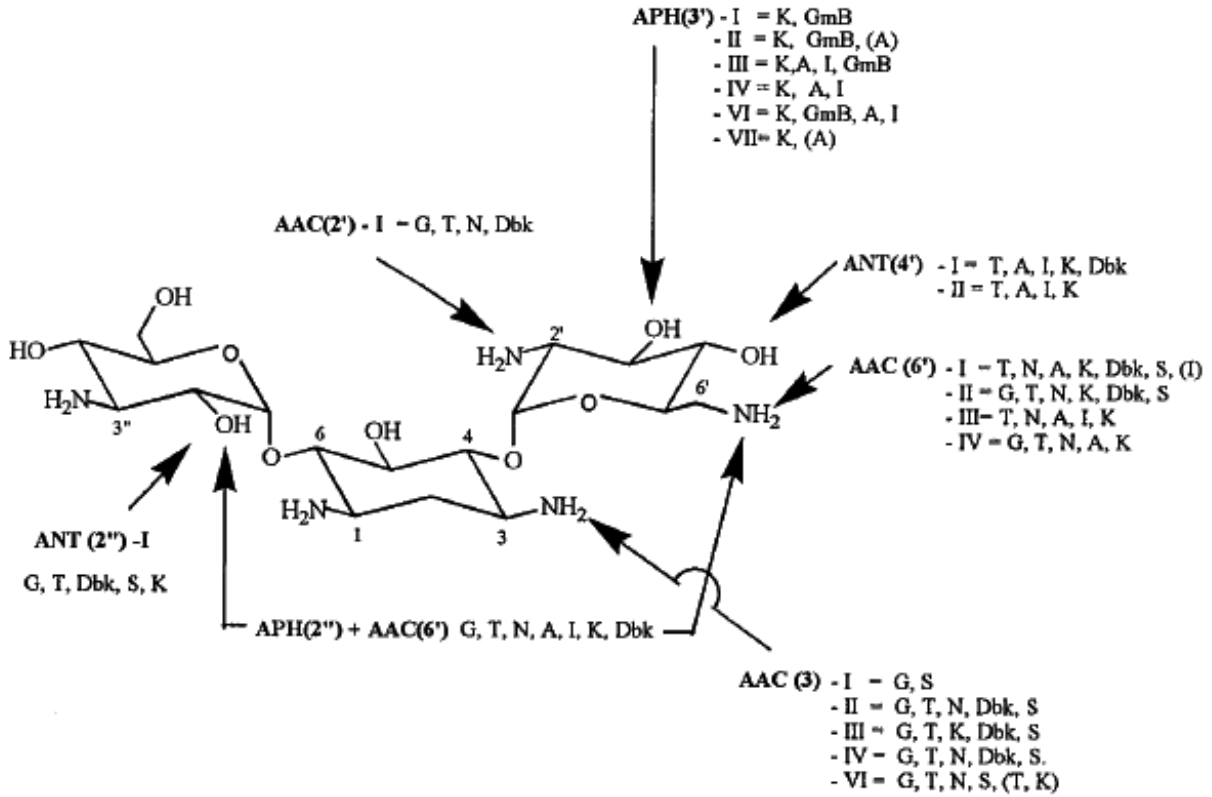

FIG. 3. Major aminoglycoside-modifying enzymes acting on kanamycin B (this aminoglycoside is susceptible to the largest number of enzymes). Each group of enzymes inactivates specific sites, but each of these sites can be acted upon by distinct isoenzymes (roman numerals) with different substrate specificities (phenotypic classification; each phenotype comprises several distinct gene products [denoted by lowercase letters after the roman numeral in the text]); at least one enzyme is bifunctional and affects both positions 2″ (*O*-phosphorylation) and 6′ (*N*-acetylation)). The main clinically used aminoglycosides on which these enzymes act are as follows: amikacin (A), dibekacin (Dbk), commercial gentamicin (G) (see text), gentamicin B (GmB), kanamycin A (K), isepamicin (I), netilmicin (N), sisomicin (S), and tobramycin (T) (see text for discussion of arbekacin, sagamicin, and dactimicin). The drug abbreviations which appear in parentheses are those for which resistance was detectable in vitro even though clinical resistance was not conferred. Based on the data of Shaw et al. (89).

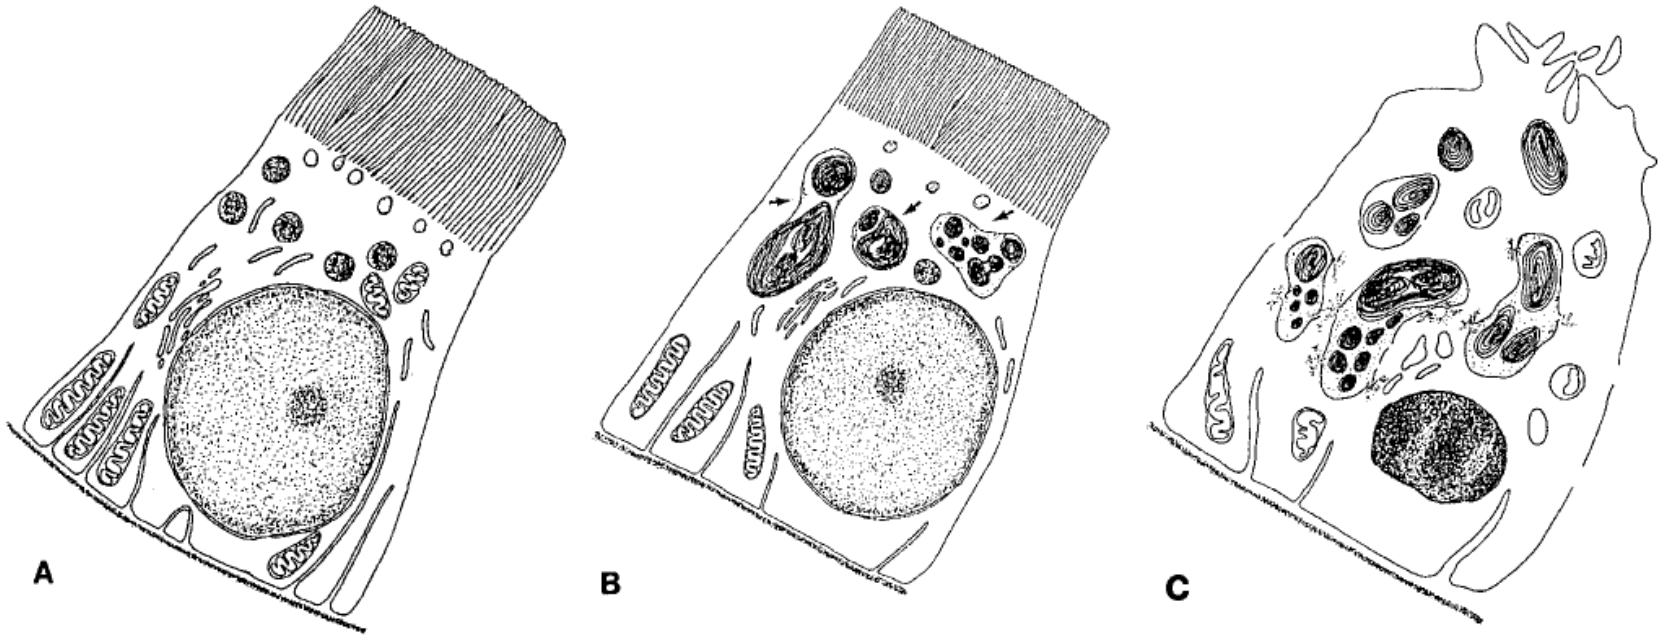

FIG. 1. Ultrastructural alterations induced in proximal tubular cells during aminoglycoside treatment. (A) Control. Changes detected early on and at low doses (B) consist mainly of the enlargement of lysosomes, which most likely occurs by fusion of preexisting structures and which is caused by the progressive deposition of polar lipids which adopt a concentric lamellar disposition (myelin-like structures, most commonly referred to as *myeloid bodies*); the other subcellular structures are usually well preserved. Later changes or changes observed with high doses (C) include the apparent rupture of lysosomes (with the release of myeloid bodies in the cytosol), extensive mitochondrial swelling and damage, dilatation of the endoplasmic reticulum cisternae, shedding of the apical brush-border villi, pericellular membrane discontinuities, and the occurrence of apoptotic nuclei. These alterations do not necessarily coexist in all cells. The figure is adapted from reference 76 and is based on the typical descriptions given in references 38, 40, 71, 76, 77, 127, and 138.

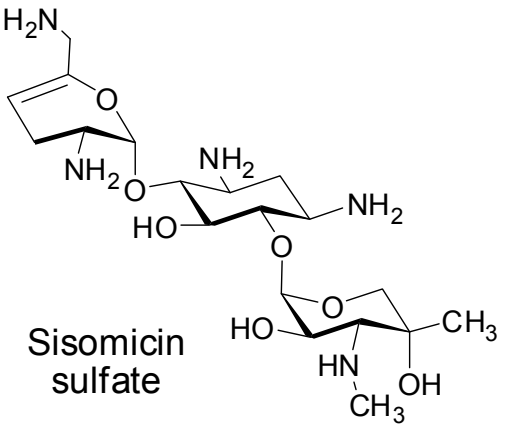
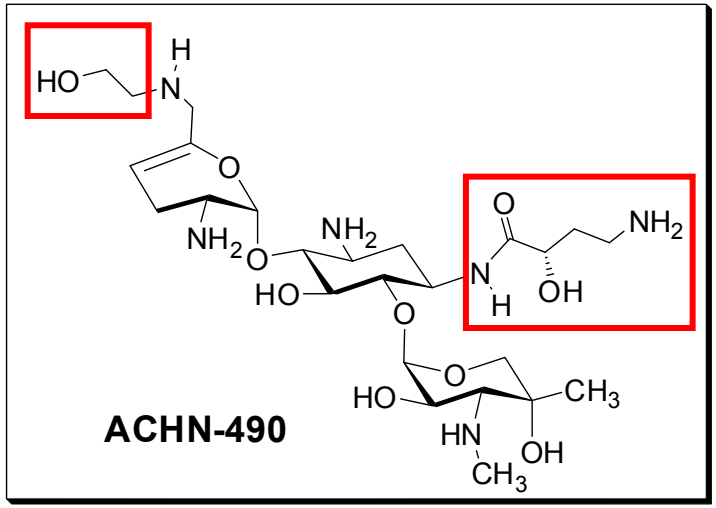
Synthesis and Structure of the novel aminoglycoside ACHN-490

- ACHN-490 is a derivative of sisomycin (known to be highly active but toxic)
- The modifications made provide protection against most pevalent AMEs
- Equally active against gentamicin-S and gentamicin *Enterobacteriaceae* and *Staphylococci*
- less toxic than gentamicin in *in vitro* and animal studies
- Indications currently tested include cUTI, HAP, cIAI, and blood stream infections



8 Steps



Aggen J, et al, ICAAC 2009 Poster F1-840

Activity of ACHN-490 against Contemporary Gram-Negative Clinical Isolates from Brooklyn, NY Hospitals

Organism	Agent	MIC_{50}	MIC_{90}	%S
K. pneumoniae **(n=71)**	ACHN-490	0.5	1	
	Amikacin	16	64	58%

Extensive Safety Monitoring
Focused on Nephrotoxicity and Ototoxicity showed no major effect

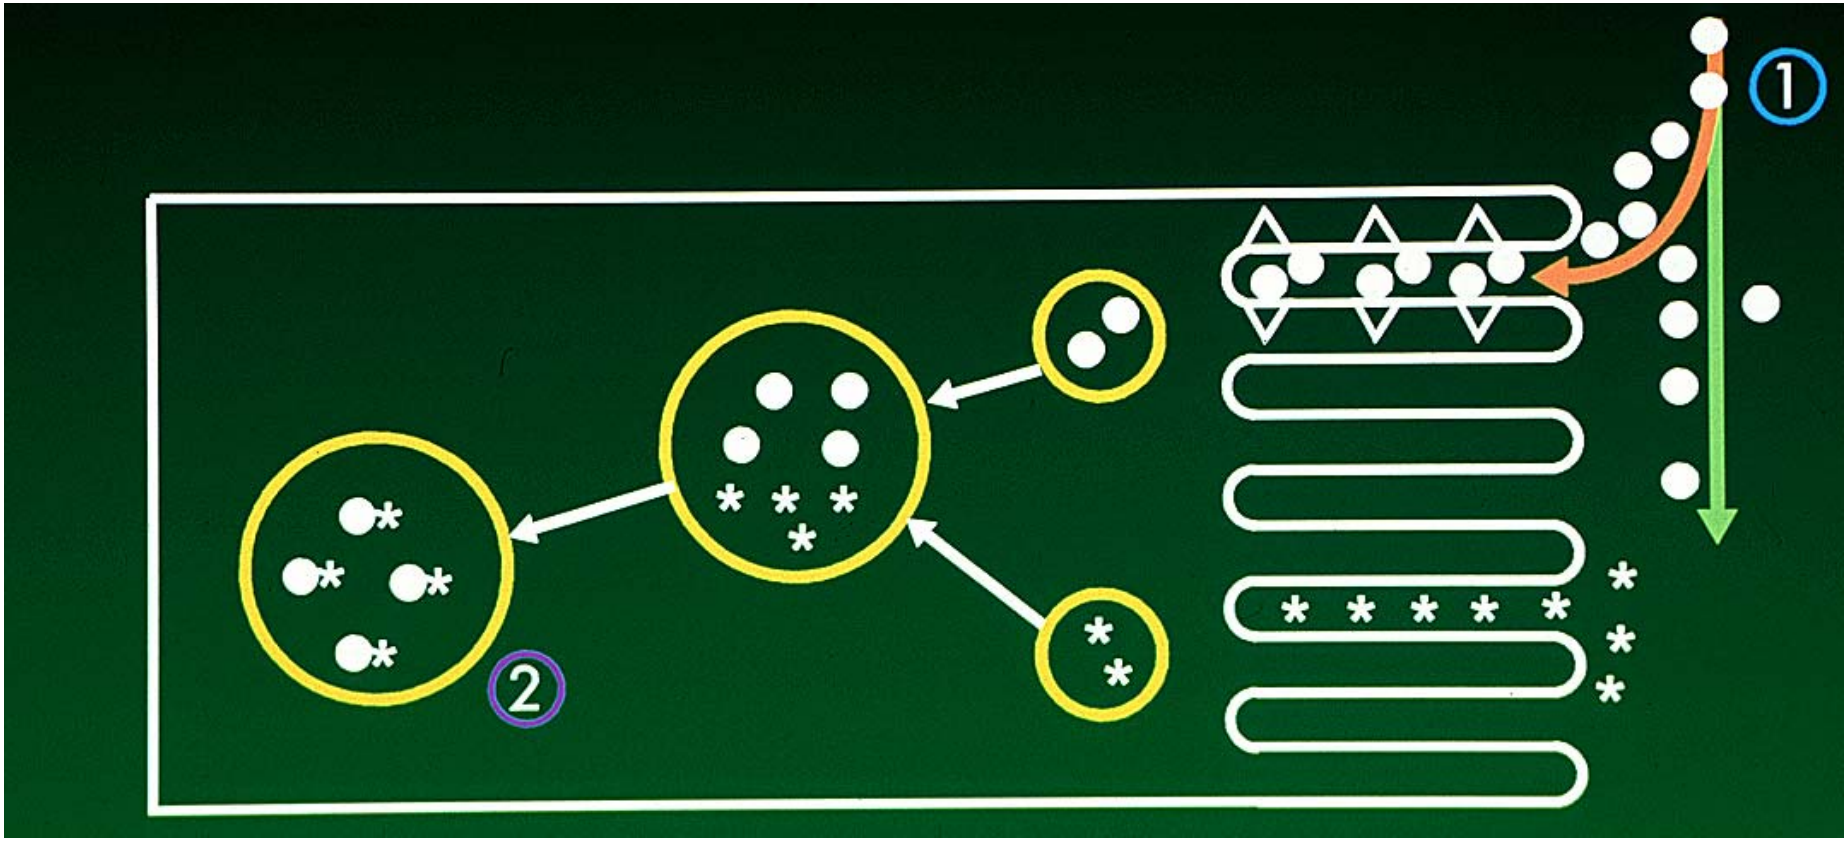
- Adverse Event monitoring
- Routine safety laboratory assessments
- Renal
  - Daily BUN & Cr during dosing
  - Calculated Creatinine clearance using Cockroft-Gault formula
  - Measured Creatinine clearance based on 24-hour urine collection
  - Additional GFR monitoring through Iothalamate clearance
- Cochlear
  - Full Audiograms with bone conduction
    - Test range 2 to 20 kHz (normal hearing range 2 to 8 kHz)
  - Daily Otoacoustic Emission (OAE) testing during multiple dose period
- Vestibular
  - Full Electronystagmography (ENG) with calorics
    - Tests: Unilateral Weakness, Directional Preponderance, Pendulum Tracking, Fixation
  - Daily Dynamic Visual Acuity (DVA) tests during multiple dose period

with once-daily dosing

- phase I
- phase II

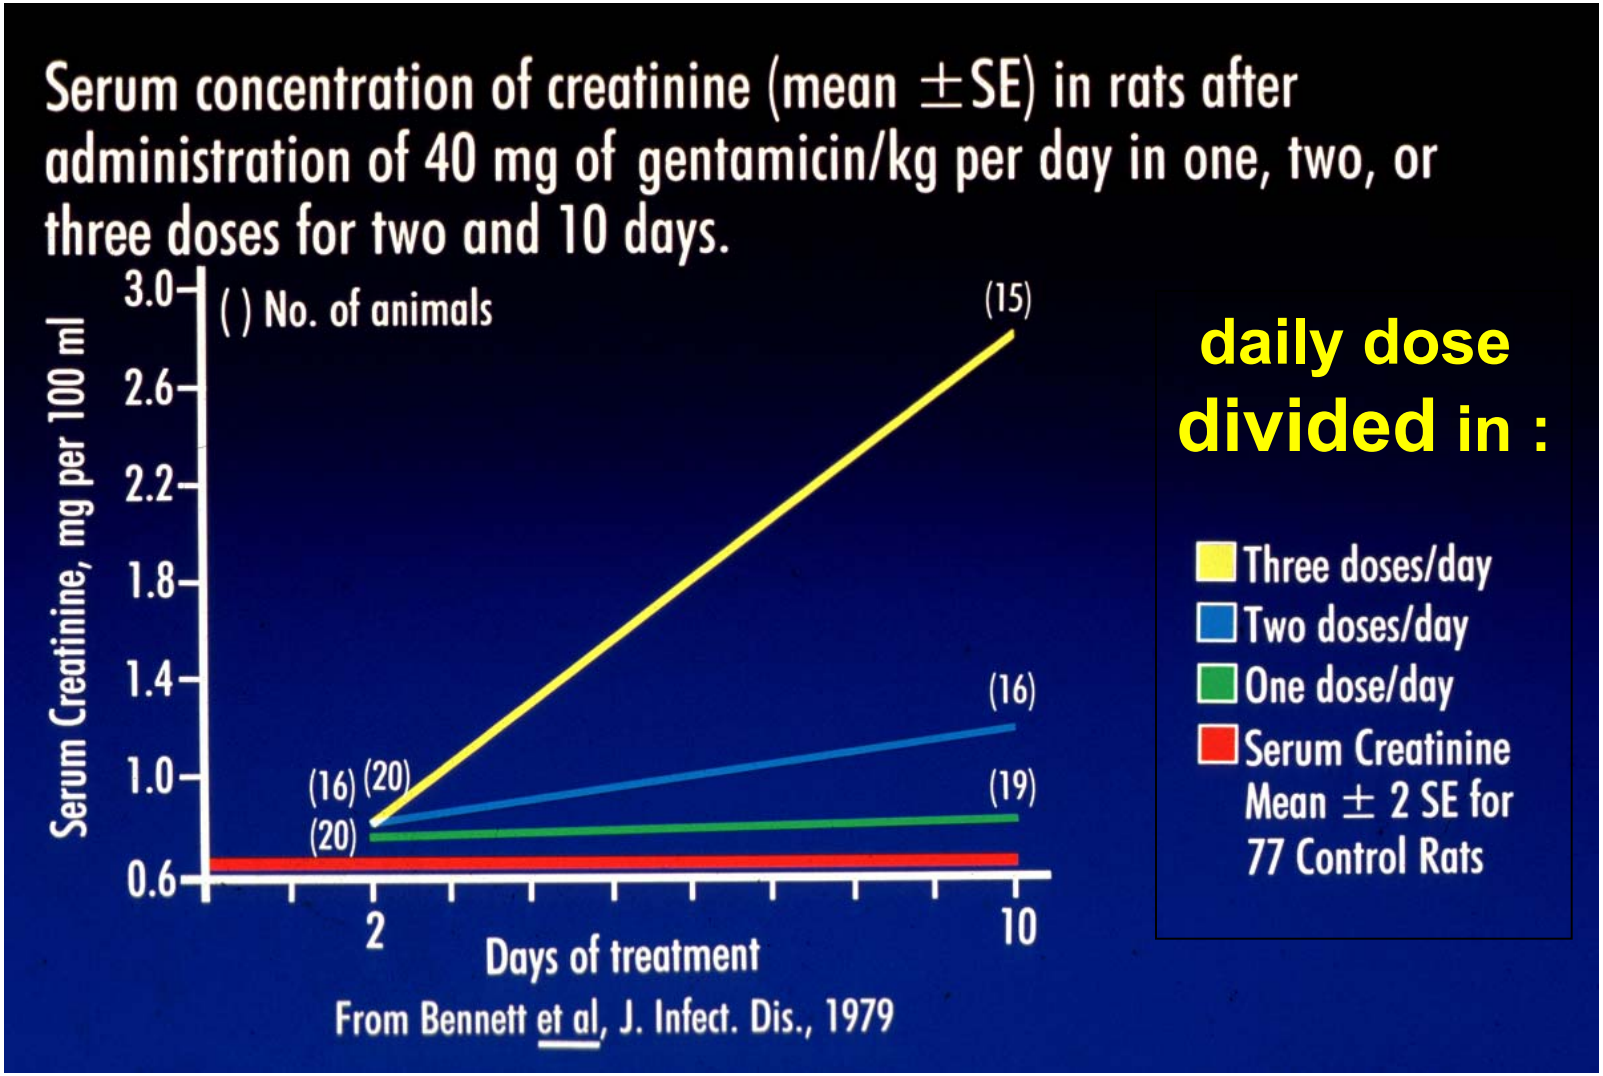
phase III ongoing !

Why are aminoglycosides nephrotoxic ?

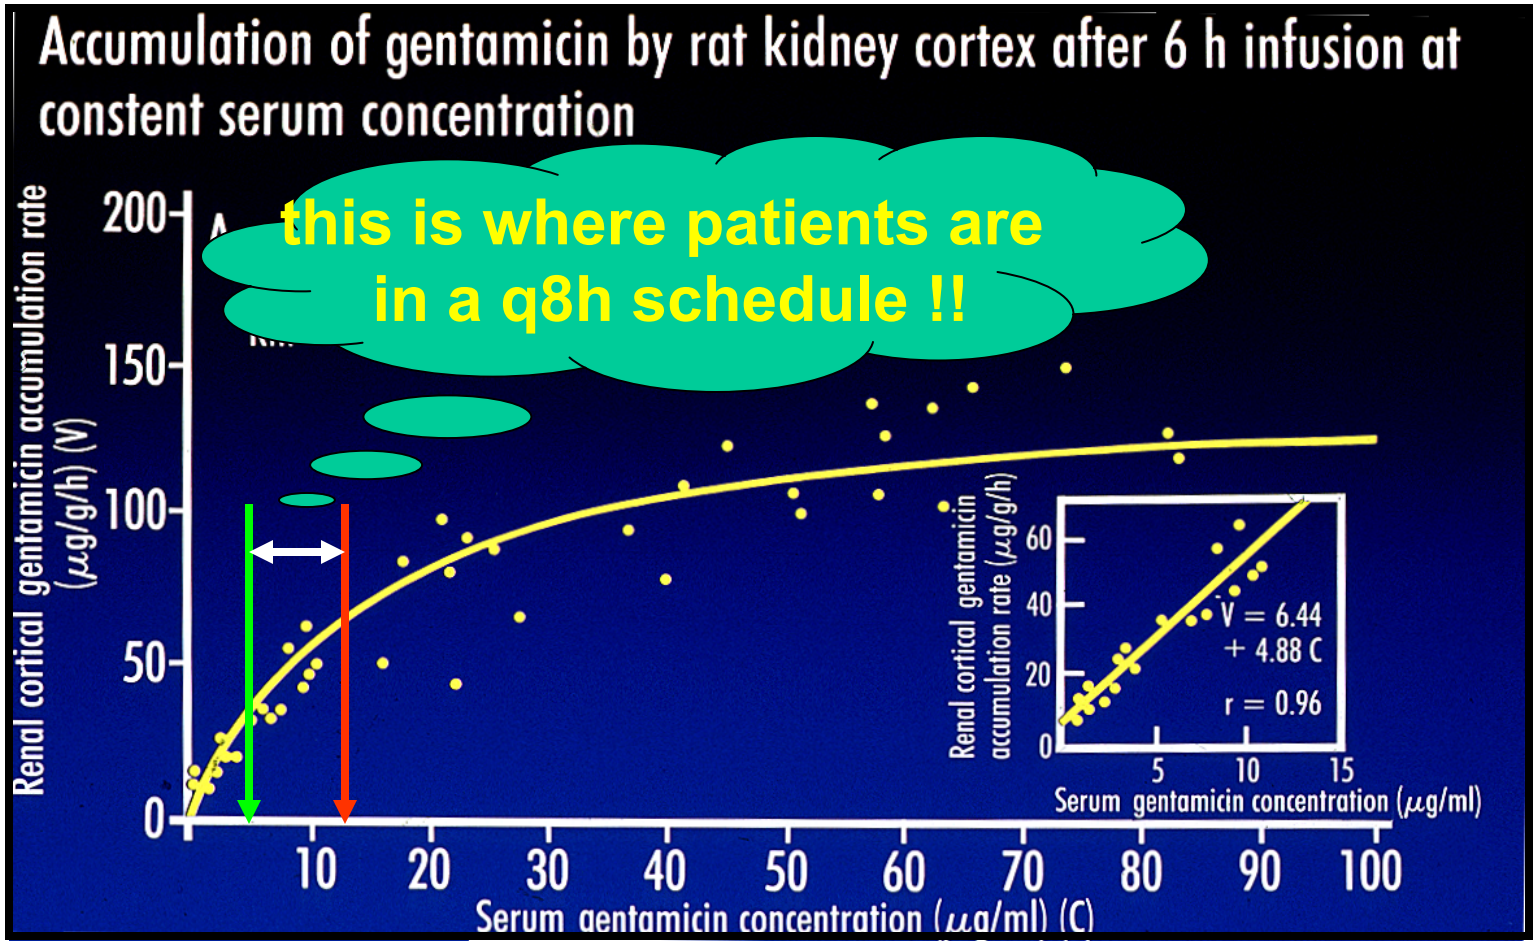


1. **binding to brush border**
2. **accumulation in lysosomes**

Observation: aminoglycoside toxicity is not linked to peak ...

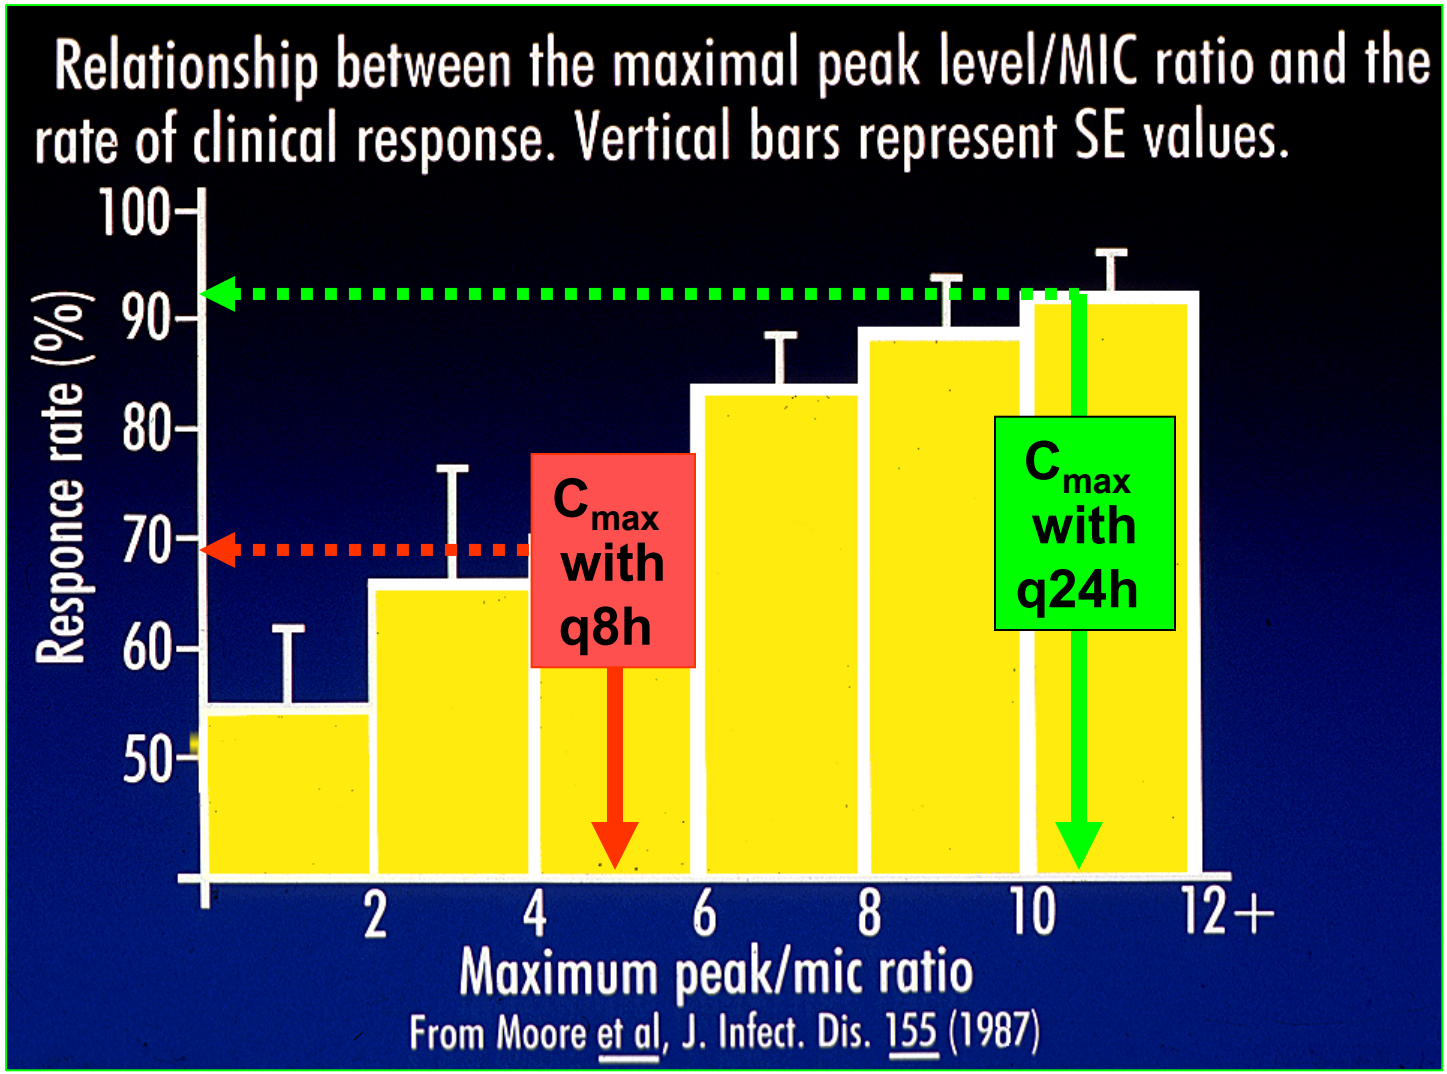


Aminoglycoside accumulation is kidney is saturable at clinically meaningful concentrations * ...

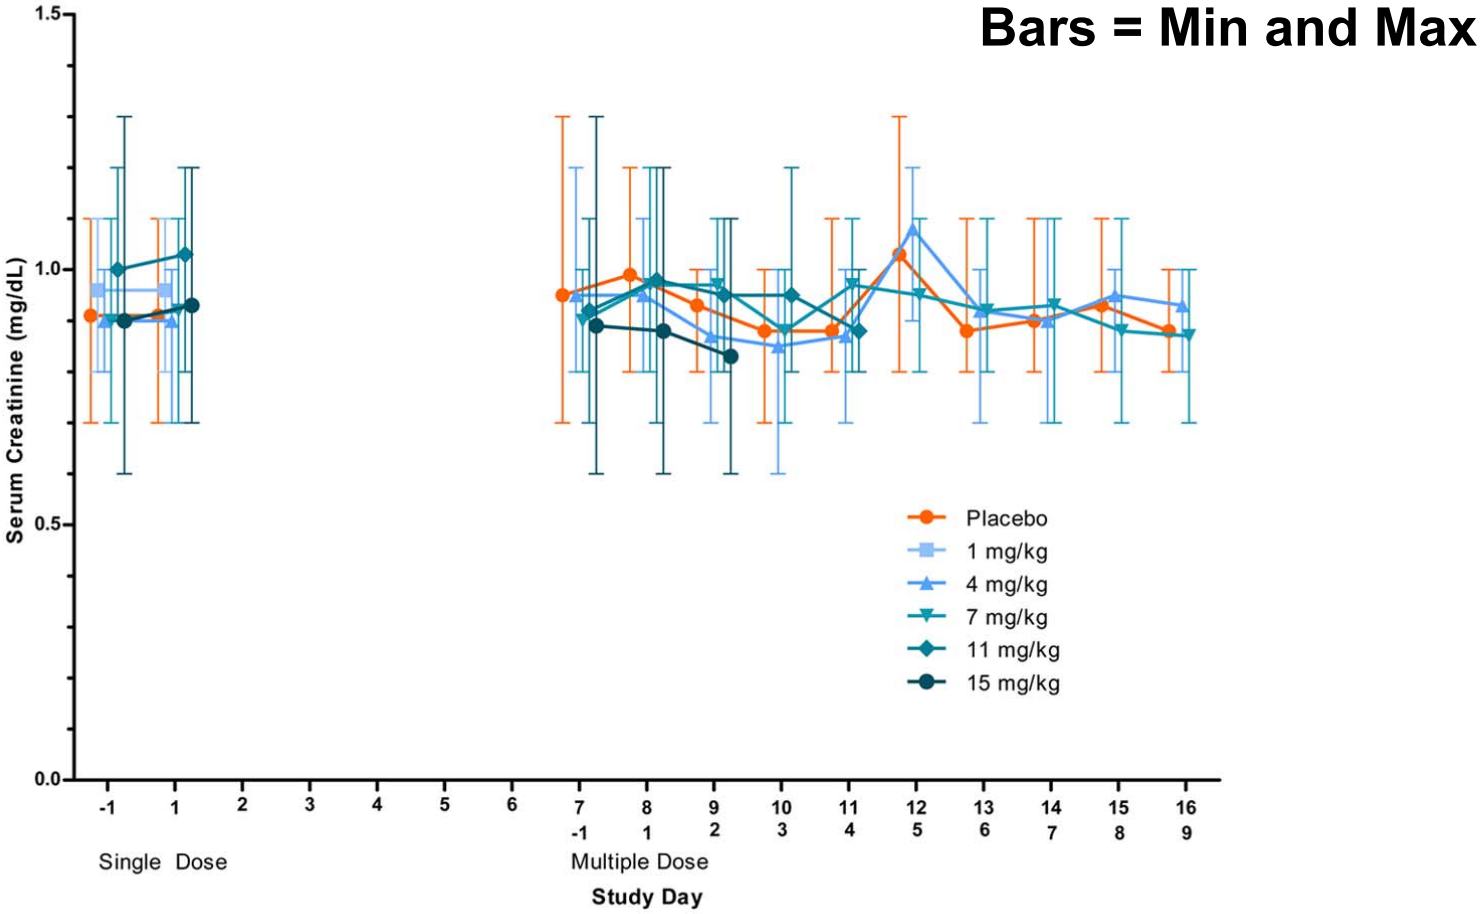


* Giuliano *et al.*, J. Pharm. Exp. Ther., 1986

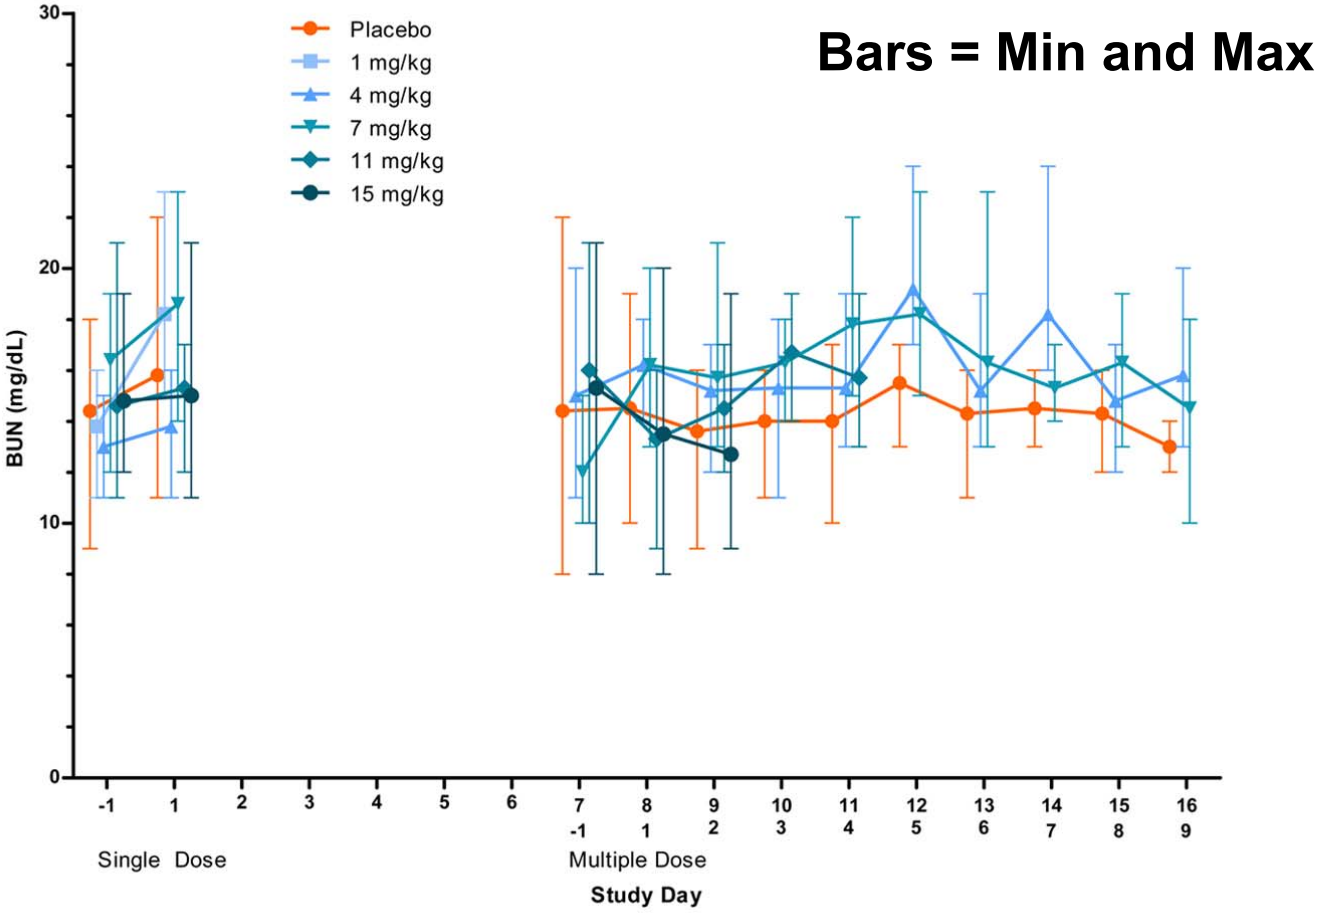
Aminoglycoside peak / MIC ratio is predictive of clinical efficacy



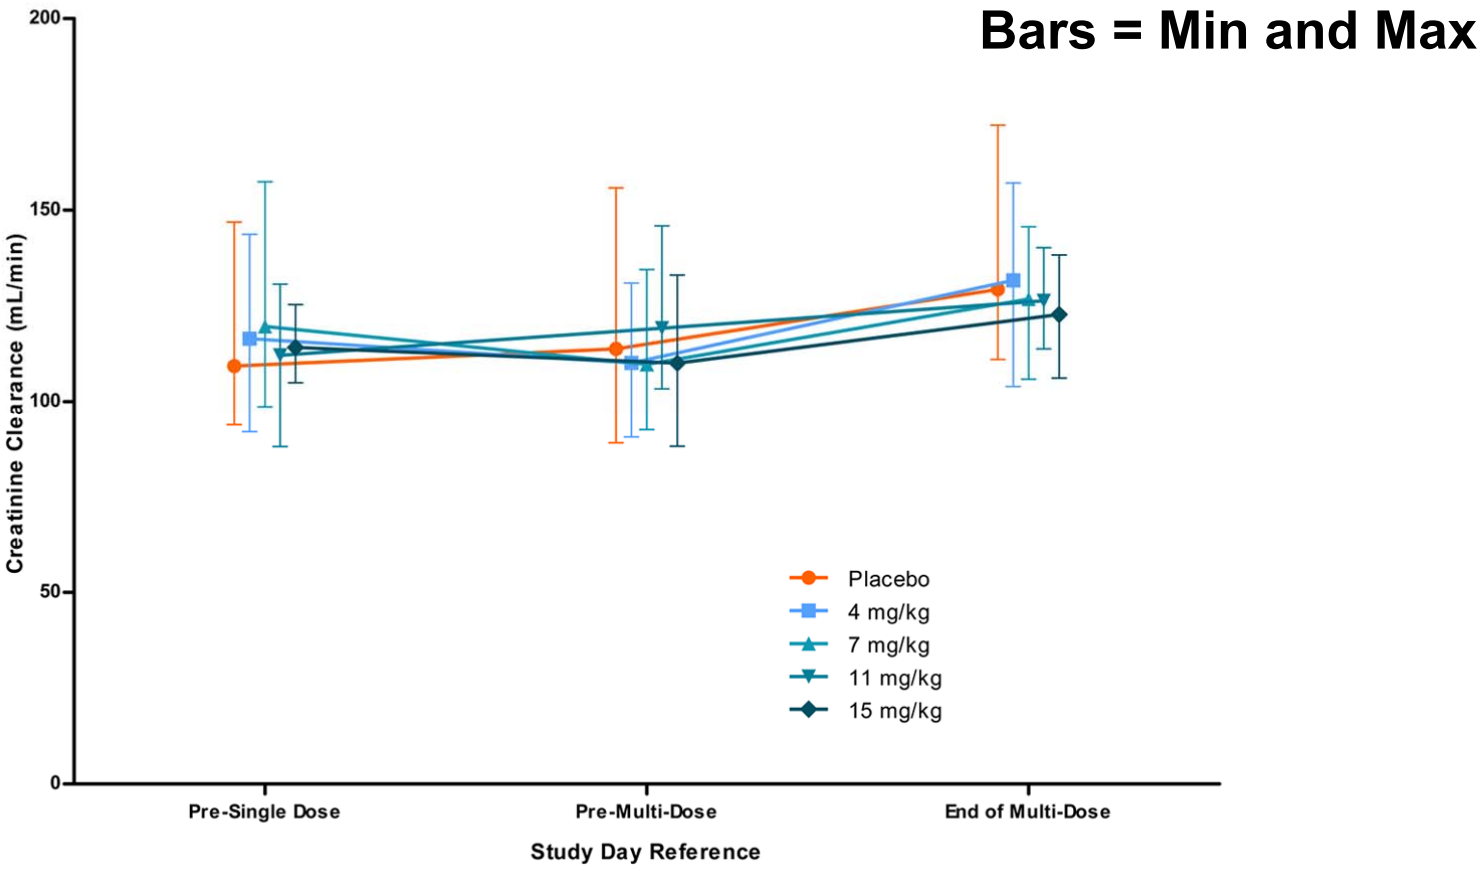
ACHN-490: No Evidence of Nephrotoxicity Based on Daily Serum Creatinine



ACHN-490: No Evidence of Nephrotoxicity Based on Daily BUN Measurements



ACHN-490: No Evidence of Nephrotoxicity Based on Measured Creatinine Clearance



Refurbishing old antibiotic:
2. Novel polymyxins * ?

- Colistin (Polymyxin E; discovered in 1949 and without clinical use for long) has now become the "last resource" antibiotics in the treatment of infecions caused by multi-resistant organisms…

Colistin: the revival of polymyxins for the management of multidrug-resistant gram-negative bacterial infections.
Falagas ME, Kasiakou SK.
Clin Infect Dis. 2005 May 1;40(9):1333-41. Epub 2005 Mar 22. Review. Erratum in: Clin Infect Dis. 2006 Jun 15;42(12):1819. Dosage error in article text.
PMID: 15825037 [PubMed - indexed for MEDLINE] **Free Article**
Related citations

- But colistin is a fairly toxic antibiotic (nephrotoxicity), which limits the concentrations that can be safely used, and therefore, limits its activity).
- Polmyxin B is more active but more toxic …
- Better compounds are badly needed, but the mode of action of colistin (membrane permabilization) should be retained because it ensures a fast bactericidal effect AND synergy with other antibiotics

Temocillin revived

David M. Livermore[1]* and Paul M. Tulkens[2]

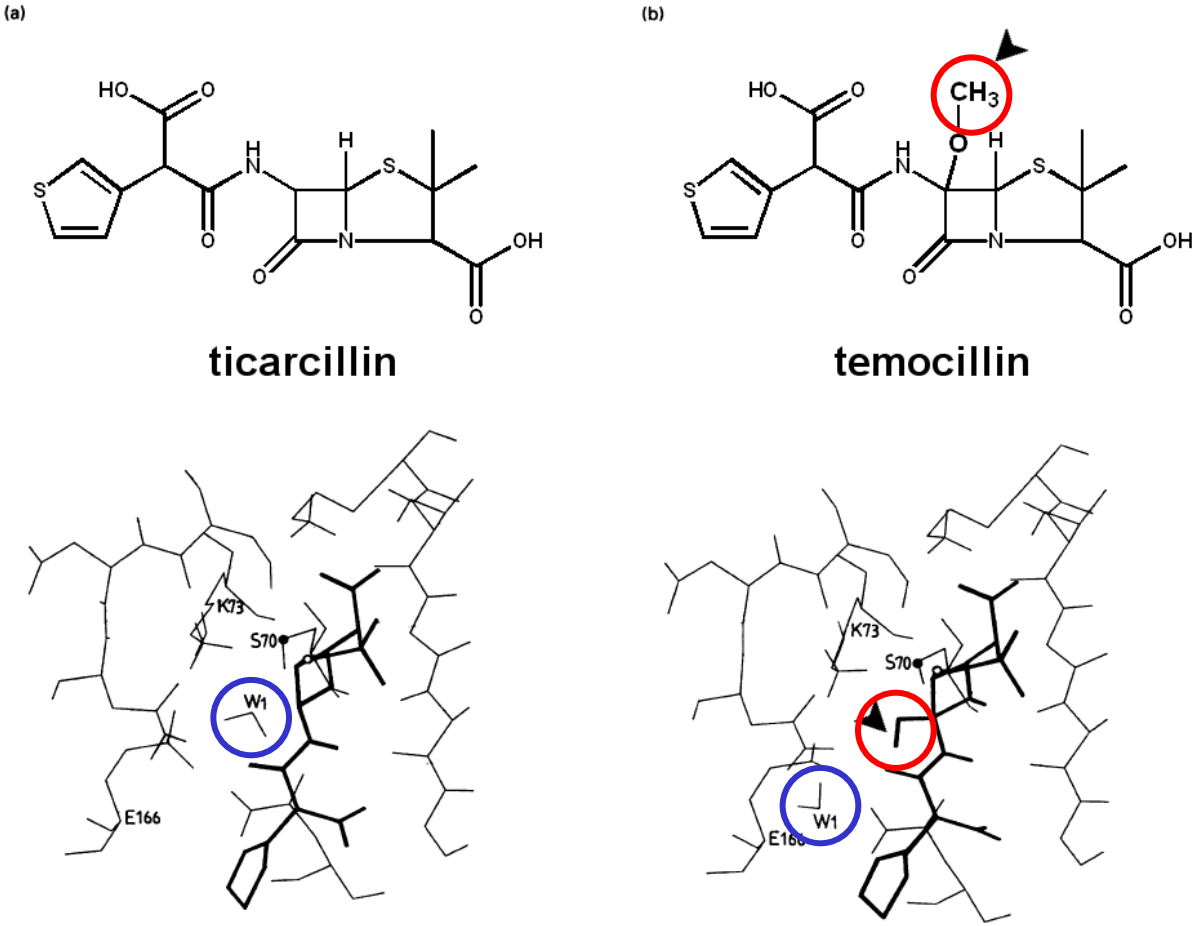
[1]*Antibiotic Resistance Monitoring and Reference Laboratory, Health Protection Agency Centre for Infections, 61 Colindale Avenue, London NW9 5EQ, UK;* [2]*Unité de Pharmacologie Cellulaire et Moléculaire & Centre de Pharmacie Clinique, Université Catholique de Louvain, Bruxelles, Belgium*

Resistance in Gram-negative pathogens is an increasing concern, with carbapenems often appearing as the only acceptable treatment option in serious infections. Reviving older compounds that have fallen into disuse may help to alleviate this burden. Temocillin (6-α-methoxy-ticarcillin) is resistant to most if not all classical and extended-spectrum β-lactamases and to AmpC enzymes. It is also chemically stable, allowing administration by continuous infusion. Pharmacokinetic/pharmacodynamic analysis, aided by Monte-Carlo simulations, suggests a breakpoint of 8 mg/L for the registered maximum dosage of 4 g daily. Temocillin's weaknesses, explaining its limited previous use, are a lack of activity against Gram-positive organisms, anaerobes and *Pseudomonas*. In settings where these are unlikely or are covered by other agents, temocillin may be useful, potentially 'sparing' carbapenems and having little apparent potential to select for *Clostridium difficile*.

---

* in collaboration with Eumedica (Belgian SME)

Temocillin in a nutshell

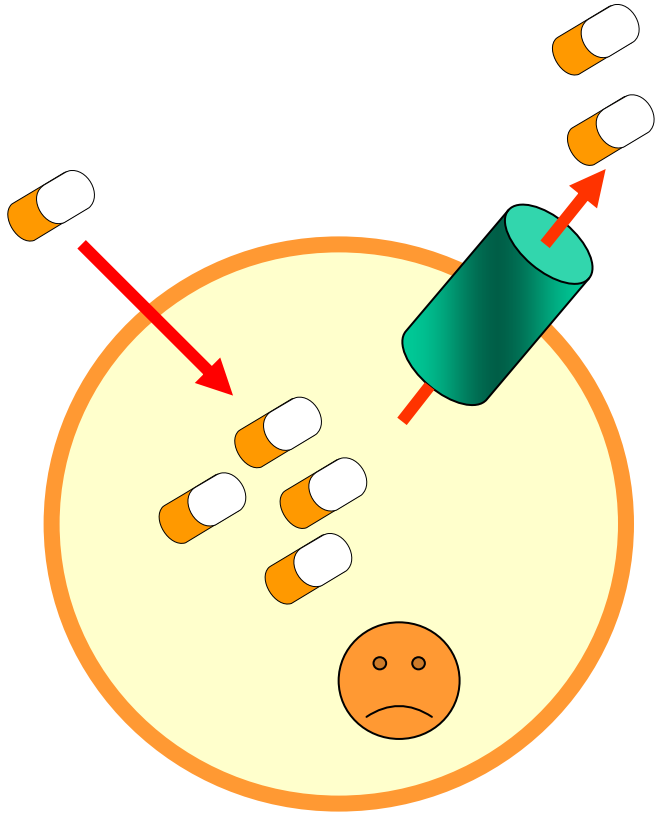


The α-methoxy group (arrow) in temocillin blocks access of water (W1) to the active serine (S70) of β-lactamase, thereby blocking the chain of molecular events leading to hydroysis

Matagne *et al.* Biochem J 1993; 293:607-11

Efflux and resistance

- efflux is a universal mechanism for cell protection against "toxic" membrane-diffusing agents
- many drugs diffuse though membranes because we made them amphiphilic to favor their diffusibility …and become opportunistic substrates for efflux pumps
- for AB, efflux decreases the amount of drug in bacteria and impairs activity, increasing the MIC …
- insufficient drug exposure favors the selection of less sensitive organisms



Van Bambeke et al.
J Antimicrob Chemother. 2003;51:1055-65.

Why is temocillin not active against *P. aeruginosa* ?

Table 1. MICs of temocillin and ticarcillin against *P. aeruginosa* strains with known expression of the efflux Mex components in Mueller-Hinton broth (MHB) and in MHB supplemented with the broad spectrum efflux transporter inhibitor Phe-Arg-β-naphthylamide (PAβN; 50 µg/mL)

Strains	Origin or Ref.	Description	Expression of Efflux system					MIC (mg/L)	
			AB [a]	XY [a]	OprM [a]	CD [b]	EF [b]	Temocillin (+PAβN)	Ticarcillin (+PAβN)
Reference strain									
PAO1	ATCC		1	1	1	-	-	256 (64)	32 (16)
Clinical isolates									
12	d		**3.97**	9.04	ND	+	+	**512** (128)	64 (64)
11	d		**3.56**	5.68	ND	-	-	**>512** (64)	32 (32)
156	d		0.33	0.95	ND	-	+	512 (64)	256 (32)
68	d		0.87	44.94	ND	-	-	512 (64)	32 (16)
333A	d		**2.17**	2.29	ND	-	-	**>1024** (1024)	128 (128)
34	d		**6.86**	1.26	ND	-	-	**>1024** (512)	256 (128)
168B	d		1.15	0.89	ND	-	-	256 (32)	16 (16)
Engineered strains									
FB1	3	PAO1Δ(*mexB::FRT*)	ND	ND	ND	ND	ND	**2**	0.5
PAO1 *mexAB*	4	PAO1Δ(*mexAB::FRT*)	**0**[e]	1.08	ND	-	+	**4** (2)	2 (2)
PAO200	4	PAO1Δ(*mexAB-oprM*)	**0**[e]	1.26	ND	-	-	**4** (0.5)	2 (0.5)
CB536	5	PAO1Δ(*mexCD-oprJ*)	1.09	1.65	ND	-	+	128 (16)	8 (1)
CB603	5	PAO1Δ(*mexEF-oprN*)	1.21	1.06	0.51	-	-	128 (32)	16 (16)
CB602	5	PAO1Δ(*mexXY-oprM*)	1.10	0.06	0.55	-	+	64 (16)	16 (16)
PAO1Δ(oprM)		PAO1 Δ(*oprM*)	ND	ND	ND	ND	ND	**2**	0.5
4098	6	Clinical strain	1.26	1.62	0.33	-	-	256 (128)	32 (32)
4098E	6	4098 overproducing OprM	**5.41**	1.31	**3.19**	-	-	**1024** (512)	64 (32)
4098ET	6	4098E Δ(*oprM*)	2.18	0.04	**0.02**	-	-	**2** ([f])	2 ([f])

[a] Real-time PCR (threshold ratio compared to PAO1; values of ≥ 2 and 5 are considered to denote highly significant overexpression of *mexAB* and *mexXY*, respectively. [b] RT-PCR (qualitative detection [+ / -]). [c] Phe-Arg-β-naphthylamide (broad spectrum efflux inhibitor) used at 50 mg/L. [d] isolated from Intensive Care patients with a clinical diagnostic of health care-associated pneumonia. [e] complete absence of detection. [f] No growth, PAβN MIC = 25 mg/L.
