Chapter 17: Principles of Anti-infective Therapy George M. Eliopoulos Robert C. Moellering Jr.*

"In choosing the appropriate antimicrobial agent for therapy for a given infection, a number of factors must be considered.

- First, the **identity of the infecting organism must be known** or, at the very least, it must be possible to arrive at a statistically **reasonable guess as to its identity** on the basis of clinical information.
- Second, information about the **susceptibility of the infecting organism**, or **likely susceptibility**, must be as accurate as possible.
- Finally, a series of **factors specific to the patient who is being treated** (*and his/her disease*) must be considered to arrive at the optimal choice of antimicrobial agent. "

Here are the questions ...

When choosing an antibiotic, do we know

1. for the organism

- its identity and whether it is causal or not
- its susceptibility to and the main key properties of the proposed antibiotic

2. for the patient

- the antibiotic effectiveness in the specific disease
- how to dose the antibiotic appropriately
- how to prevent / avoid patient- and drug-related side effects

3. for Society

- how to prevent emergence of resistance
- how to get "value for money"

Please, think about
what YOU would answer !

Possible answers for the organism ...

When choosing an antibiotic, do we know

1. for the organism

– **its identity and whether it is causal or not ?**

If sample(s) is (are) available, use of all "possible" techniques

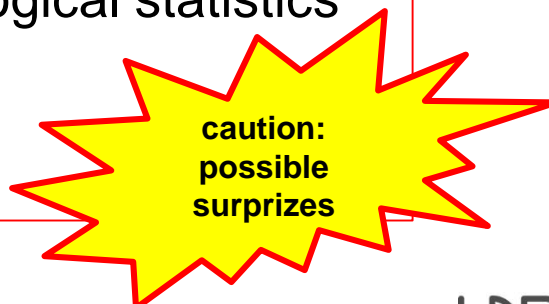

- Gram stain and direct microscopy examination...
- rapid immunological and molecular techniques...
- culture and identification (galleries / MALDI-TOF)...
- quantitative cultures

**caution:
garbage in –
garbage out**

If no sample is available... we must use "bacteriological statistics"

- likelihood to cause a specific infection
- endogenous and/or environmental presence

**caution:
possible
surprises**

Possible answers for the organism ...

When choosing an antibiotic, do we know

1. for the organism
 - **its susceptibility to the proposed antibiotic**

Susceptibility

- are *in vitro* methods predictive (and which ones to use) ?
- which interpretive criteria ?

Know the
limits of your
methods ...

Possible answers for the organism ...

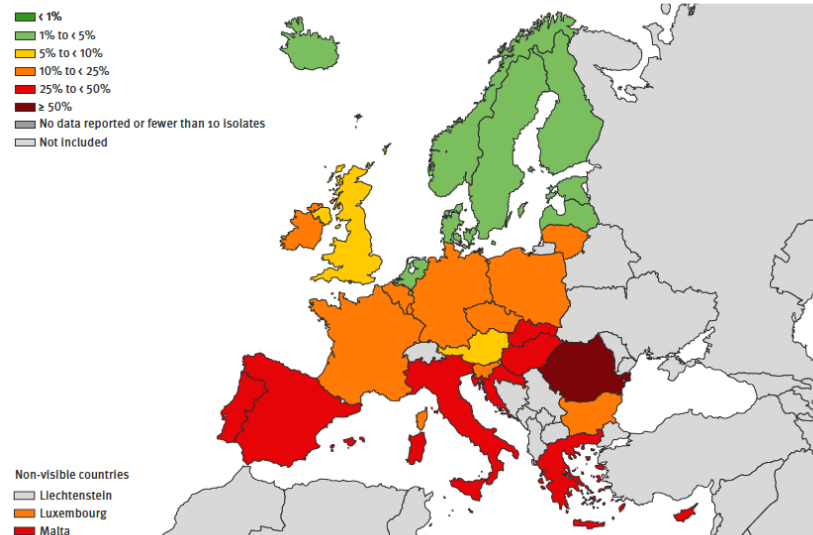

When choosing an antibiotic, do we know

1. for the organism

- the main key properties of the proposed antibiotic against the identified (or likely) target(s)

Spectrum and mode / extent of action

- the molecular parameters that differentiate drugs ...

ceftaroline
an anti-MRSA cephalosporin

ciprofloxacin
a potent fluoroquinolones

linezolid
the first oxazolidinone

From linezolid to tedizolid: what the structure tells us

Linezolid (LZD)

acetamido
vs.
free -OH

Tedizolid (TZD)

additional
methyl-
tetrazolyl

pyridinyl
replacing the
morpholinyl

Substantial differences that DO impact on

- **intrinsic activity** (*more potent*)
- **activity against LZD-resistant strains**
- **half-life** (*longer*)

Possible answers for the organism ...

The daptomycin story...

Inhibition of Daptomycin by Pulmonary Surfactant: In Vitro Modeling and Clinical Impact

Jared A. Silverman, Lawrence I. Mortin, Andrew D. G. VanPraagh, Tongchuan Li, and Jeff Alder
Cubist Pharmaceuticals, Lexington, Massachusetts

clinical
demonstration
is essential !

The lipopeptide daptomycin has been approved for use in skin and skin-structure infections but has failed to meet statistical noninferiority criteria in a clinical trial for severe community-acquired pneumonia. Daptomycin exhibited an unusual pattern of activity in pulmonary animal models: efficacy in *Staphylococcus aureus* hematogenous pneumonia and inhalation anthrax but no activity against *Streptococcus pneumoniae* in simple bronchial-alveolar pneumonia. Daptomycin was shown to interact in vitro with pulmonary surfactant, resulting in inhibition of antibacterial activity. This effect was specific to daptomycin and consistent with its known mechanism of action. This represents the first example of organ-specific inhibition of an antibiotic.

When choosing an antibiotic, do we know

2. for the patient

- how to dose the antibiotic appropriately ?

**This is where the
PK/PD guys
came in
(Stockholm, 1989)**

A simple *in vitro* comparison

- bacteria in broth
- increasing concentrations (multiples of MIC)
- measure of the change in CFUs over time

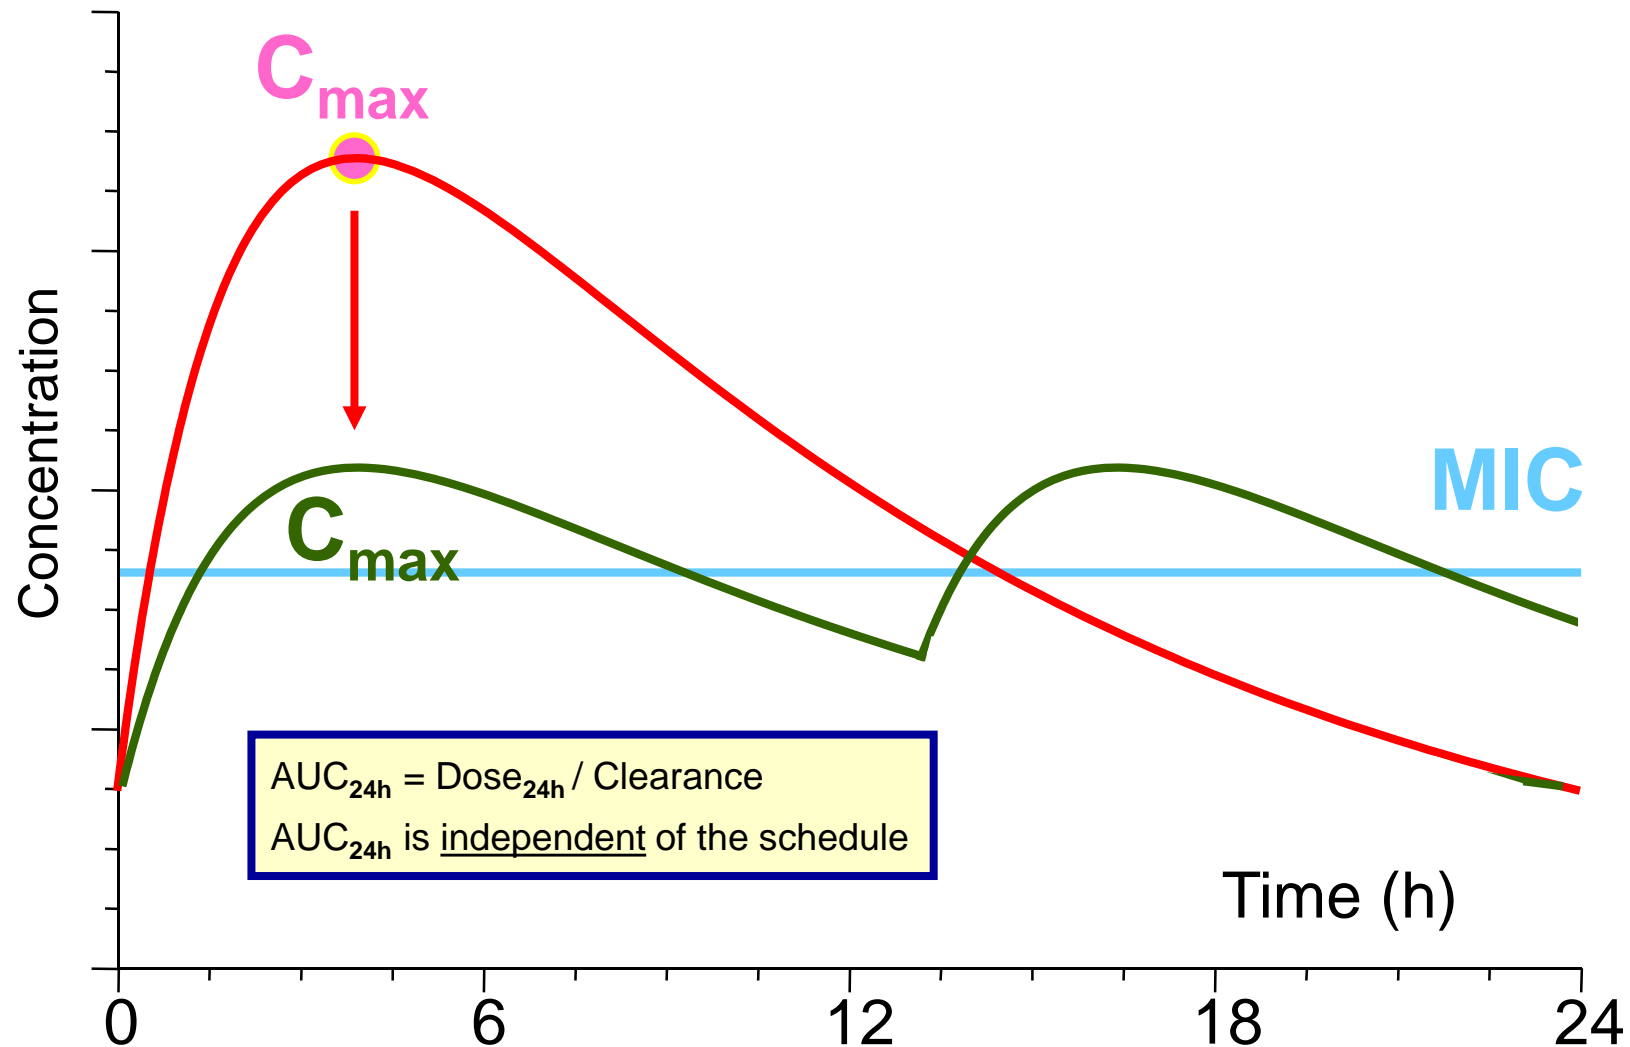

Vogelman & Craig (1986) Journal of Pediatrics 108:835-840

PK parameters governing the activity of antibiotics

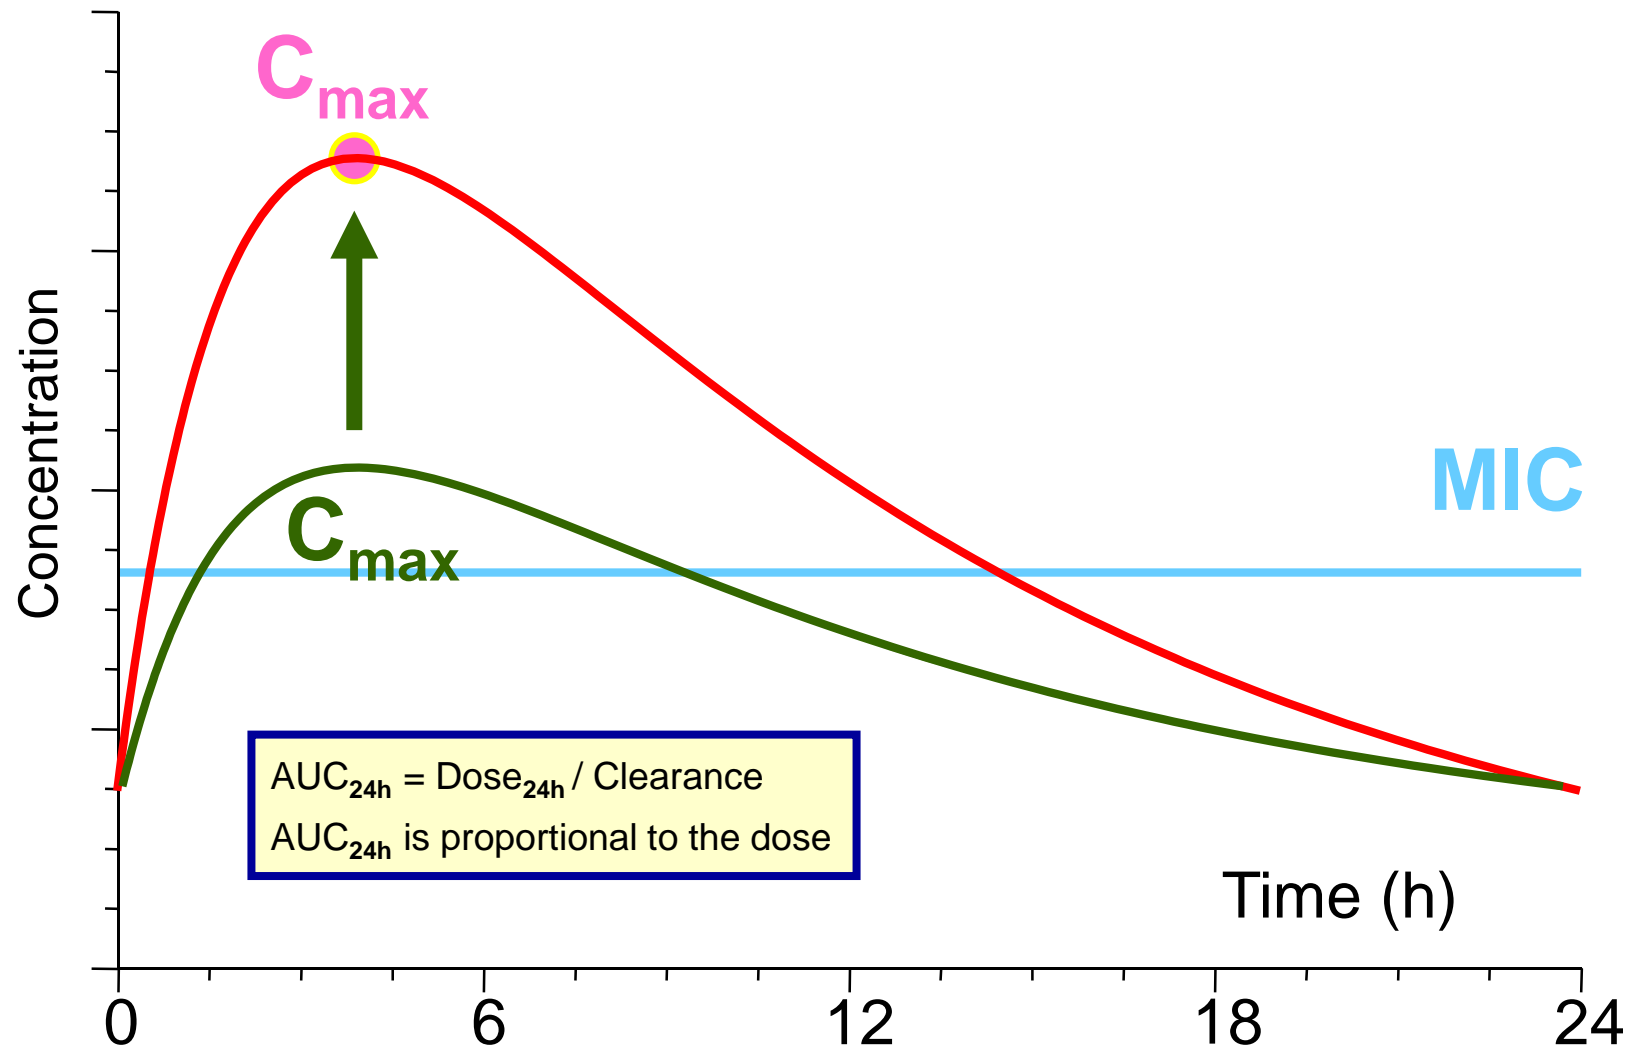

How to determine which PK parameter is critical ?

- If you fractionate the daily dose, you change C_{\max} without changing AUC_{24h}

How to determine which PK parameter is critical ?

- If you increase the dose without change of schedule, you increase BOTH C_{\max} and AUC_{24h}

The 3 main patterns of antibiotic PK/PD properties

(W.A. Craig, 2000; revised in 2003)

antibiotic	PK/PD parameter	What to do ?
β -lactams	time > MIC	stay > MIC as needed
macrolides, oxazolidinones, vancomycin...	AUC_{24h} / MIC	give a sufficient total daily dose
quinolones aminoglycosides	peak / MIC and AUC_{24h} / MIC	obtain a peak and aim for a sufficient total daily dose

* 2d ISAP Educational Workshop, Stockholm, Sweden, 2000;
revised accord. to Craig, Infect. Dis. Clin. N. Amer., 17:479-502, 2003

What should you strive for ?

concentration

E_{\max}

Maximal effect

$E_{50\%}$

E_{\min}

Minimal effect

How to be optimal ?

If you select a β -lactam ...

Breakpoint setting...

Choosing the **appropriate drug derivative** can be rewarding...

Tedizolid (TZD) vs. linezolid (LZD) safety: Platelet counts Pooled Phase 3 Studies

DeAnda *et al.* Integrated results from 2 phase 3 studies comparing tedizolid phosphate 6 days vs. linezolid 10 days in patients with ABSSSI. Poster presented at: 53rd Interscience Congress on Antimicrobial Agents and Chemotherapy (ICAAC); September 10-13, 2013; Denver, CO. (L-203).

Here are the questions ...

When choosing an antibiotic, do we know

3. for the society

- how to prevent emergence of resistance ?

Answers for Society ...

When choosing an antibiotic, do we know

3. for the society

– how to prevent emergence of resistance ?

This is probably a **most difficult challenge** because

- resistance genes are already present in nature (**resistome**)
- bacteria quickly adapt to new environments (**mutation/selection**)

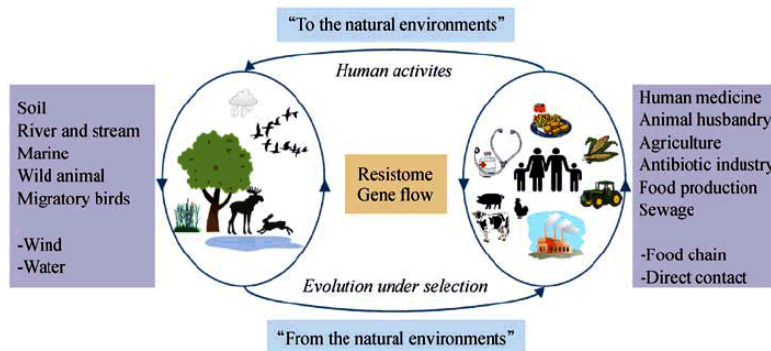

Fig. 1 The antibiotic resistome gene flow in environments, human, and animals. We propose that the antibiotic resistome gene flow is “form the natural environments” and “to the natural environments.” The natural environments are the reservoirs for antibiotic resistome. The original ARGs in environmental bacteria can be captured by human or animal pathogens and gradually evolved under the antibiotic selection pressure and become qualified. These ARGs or ARG-bearing bacteria are then disseminated back to the natural environments due to the human activities on producing and using antibiotics. In most cases, the ARGs are more easily transferred within respective ecological niches (the natural environments, and the human- and animal-associated environments). This resistance gene flow scenario is not very applicable to antibiotic resistance caused by chromosomal mutation.

Hu et al. Front Med 2017;11:161-168 - PMID: [28500429](https://pubmed.ncbi.nlm.nih.gov/28500429/)

Answers for the Society ...

MIC may increase during treatment !

Change in MIC of antibiotics used in empiric antipseudomonal therapy (nosocomial pneumonia; intensive care units) towards the isolate identified before onset of therapy (D0) vs. the last isolate (DL) collected from the same patient and with clonal similarity with the first isolate. Differences were analyzed using both raw and log₂ transformed data and found significant by both non-parametric (Wilcoxon matched pair test) and parametric (two-tailed paired t-test) analysis.

Optimization may prevent emergence of resistance

Vol. 51, No. 4

Fluoroquinolone Resistance in *Streptococcus pneumoniae*: Area Under the Concentration-Time Curve/MIC Ratio and Resistance Development with Gatifloxacin, Gemifloxacin, Levofloxacin, and Moxifloxacin[▽]

Kerry L. LaPlante,^{1,2,4,†} Michael J. Rybak,^{1,2,3,4,*} Brian Tsuji,^{1,2,4,‡}
Thomas P. Lodise,⁶ and Glenn W. Kaatz^{1,3,5}

Anti-Infective Research Laboratory, Eugene Applebaum College of Pharmacy,¹ Department of Pharmacy Practice,² and School of Medicine,³ Wayne State University, Detroit Receiving Hospital and University Health Center,⁴ and John D. Dingell Veterans Affairs Medical Center,⁵ Detroit, Michigan, and Department of Pharmacy Practice, Albany College of Pharmacy, Albany, New York⁶

LaPlante et al. Antimicrob Agents Chemother 2007;51:1315-20 - PMID: [17296740](https://pubmed.ncbi.nlm.nih.gov/17296740/)

it's all a
problem of
PK/PD

Clinical doses of moxifloxacin exceeded the *f*AUC/MIC resistance breakpoint against wild-type *S. pneumoniae*, whereas those of levofloxacin (500 and 750 mg) were associated with first- and second-step mutations.

Additionally, moxifloxacin breakpoints were significantly lower ($P < 0.002$) than those of gatifloxacin.

The order of resistance development determined from *f*AUC/MIC breakpoints was levofloxacin > moxifloxacin = gemifloxacin, which may be related to structural differences within the class.

What differentiates fluoroquinolones ?

Results with *S. pneumoniae*

Would this cause less emergence of resistance ?

Fluoroquinolone AUC/MIC ratios
for *S. pneumoniae*

Pharmacokinetics and “resistance” breakpoint vs. MIC

resistance breakpoint

- $AUC/MIC = 100$
- $peak/MIC = 10$

Levofloxacin 500 mg 1X / day

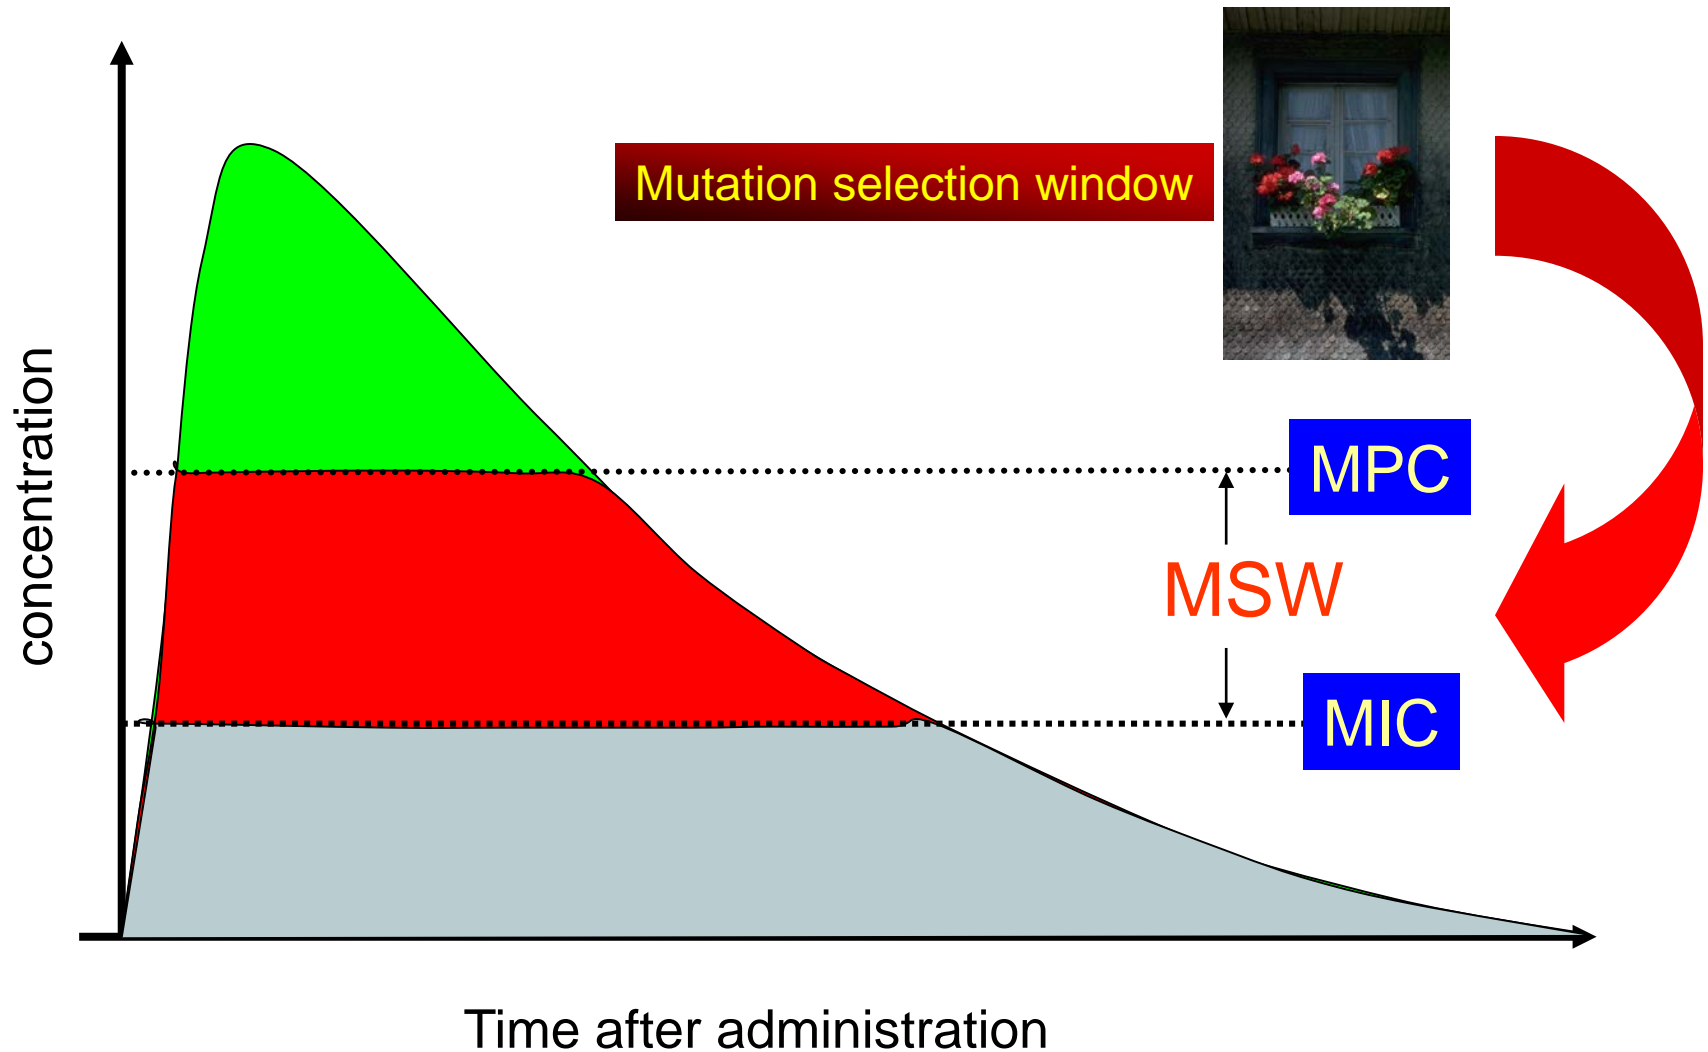

- $AUC [(mg/l) \cdot h]$ 47
- $peak [mg/l]$ 5
- ➔ $MIC_{max} \sim 0.5$

Moxifloxacin 400 mg 1X / day

- $AUC [(mg/l) \cdot h]$ 48
- $peak [mg/l]$ 4.5
- ➔ $MIC_{max} \sim 0.5$

MIC data: EUCAST MIC distributions (wild type)
PK data: US and EU labelling (typical values)

The risk for resistance to fluoroquinolones ... the MPC !

concept from Drlica & Zhao, Rev. Med. Microbiol. 2004, 15:73-80

MPC: moxifloxacin vs levofloxacin

What about the recommendations for CAP ?

ORIGINAL ARTICLE

10.1111/j.1469-0691.2011.03672.x

Guidelines for the management of adult lower respiratory tract infections - Full version

M. Woodhead¹, F. Blasi², S. Ewig³, J. Garau⁴, G. Huchon⁵, M. Ieven⁶, A. Ortqvist⁷, T. Schaberg⁸, A. Torres⁹, G. van der Heijden¹⁰, R. Read¹¹ and T. J. M. Verheij¹² Joint Taskforce of the European Respiratory Society and European Society for Clinical Microbiology and Infectious Diseases

Recommendation:

Aminopenicillin \pm macrolide^{a,b}

Aminopenicillin/ β -lactamase inhibitor^a \pm macrolide^b

Non-antipseudomonal cephalosporin

Cefotaxime or ceftriaxone \pm macrolide^b

Levofloxacin^a

Moxifloxacin^{a,c}

Penicillin G \pm macrolide

^aCan be applied as sequential treatment using the same drug.

^bNew macrolides preferred to erythromycin.

^cWithin the fluoroquinolones, moxifloxacin has the highest antipneumococcal activity.

In patients at risk of GNEB, particularly strains with ESBL, but without risk (or after exclusion of) of *P. aeruginosa*, ertapenem may be used.

Here are the questions ...

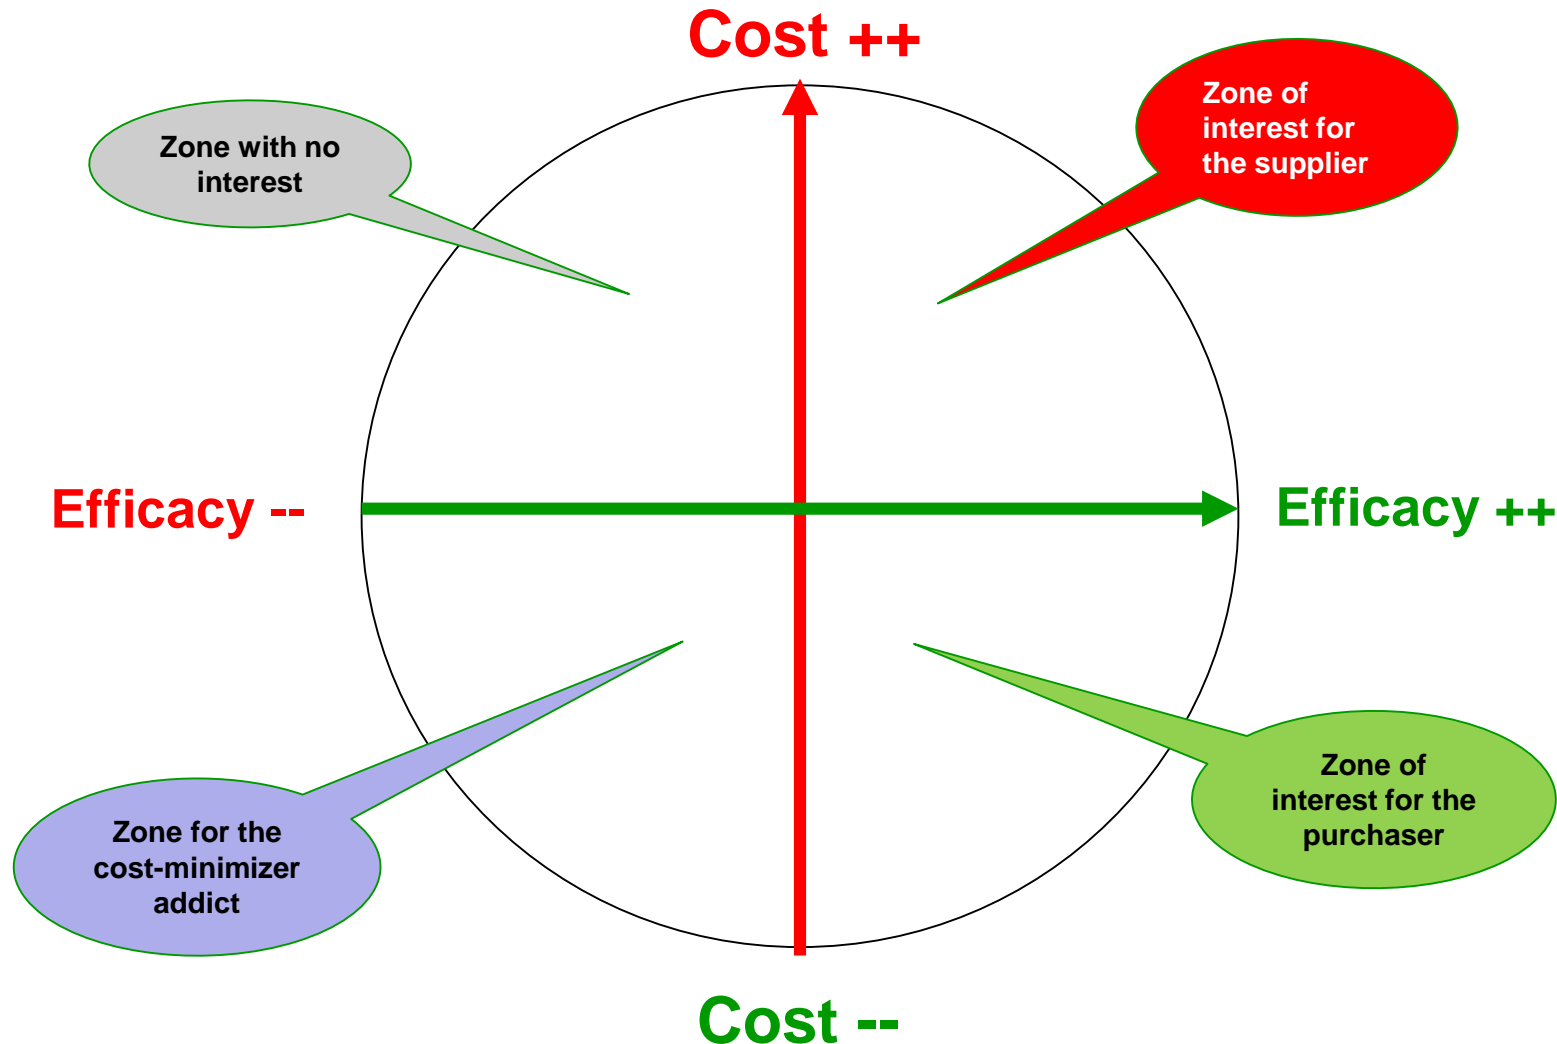

When choosing an antibiotic, do we know

3. for Society

– how to get "value for money" ?

How do you score the cost of a treatment ?

Scoring the cost of treatments

Simoens S. Biosimilar medicines and cost-effectiveness. Clinicoecon Outcomes. Res. 2011;3:29-36.

Costs: an example for vancomycin (always intravenous)

- Medical costs
 - **ordering and acquiring the drug (generic)**
 - storage in the hospital pharmacy
 - preparing the infusion (nurse's time and material)
 - infusion to the patient (twice daily) (nurse's time and material)
 - collecting and handling blood samples for monitoring (nurse's time)
 - laboratory serum level assay (cost and time)
 - maintaining the patient in the hospital for at least 10 days (daily cost)
 - managing nephrotoxicity (~ 5-10% of all patients)
- Non-medical costs
 - patient's absence from home for at least 10 days (need of external help)
 - patient's absence from work for at least 10 days (productivity loss)

The drug acquisition price of the generic vancomycin is only a small part of the total treatment cost !!!

Switching to a short course with an oral form with similar efficacy ?

- Medical costs
 - **ordering and acquiring the drug (branded drug)** ↗
 - storage in the hospital pharmacy
 - ~~preparing the infusion (nurse's time and material)~~
 - ~~infusion to the patient (twice daily) (nurse's time and material)~~
 - ~~collecting and handling blood samples for monitoring (nurse's time)~~
 - ~~laboratory serum level assay (cost and time)~~
 - maintaining the patient in the hospital for at least 10 days (daily cost) ↘
 - ~~managing nephrotoxicity (~ 5-10% of all patients)~~
- Non-medical costs
 - patient's absence from home for at least 10 days (need of external help) ↘
 - patient's absence from work for at least 10 days (productivity loss) ↘

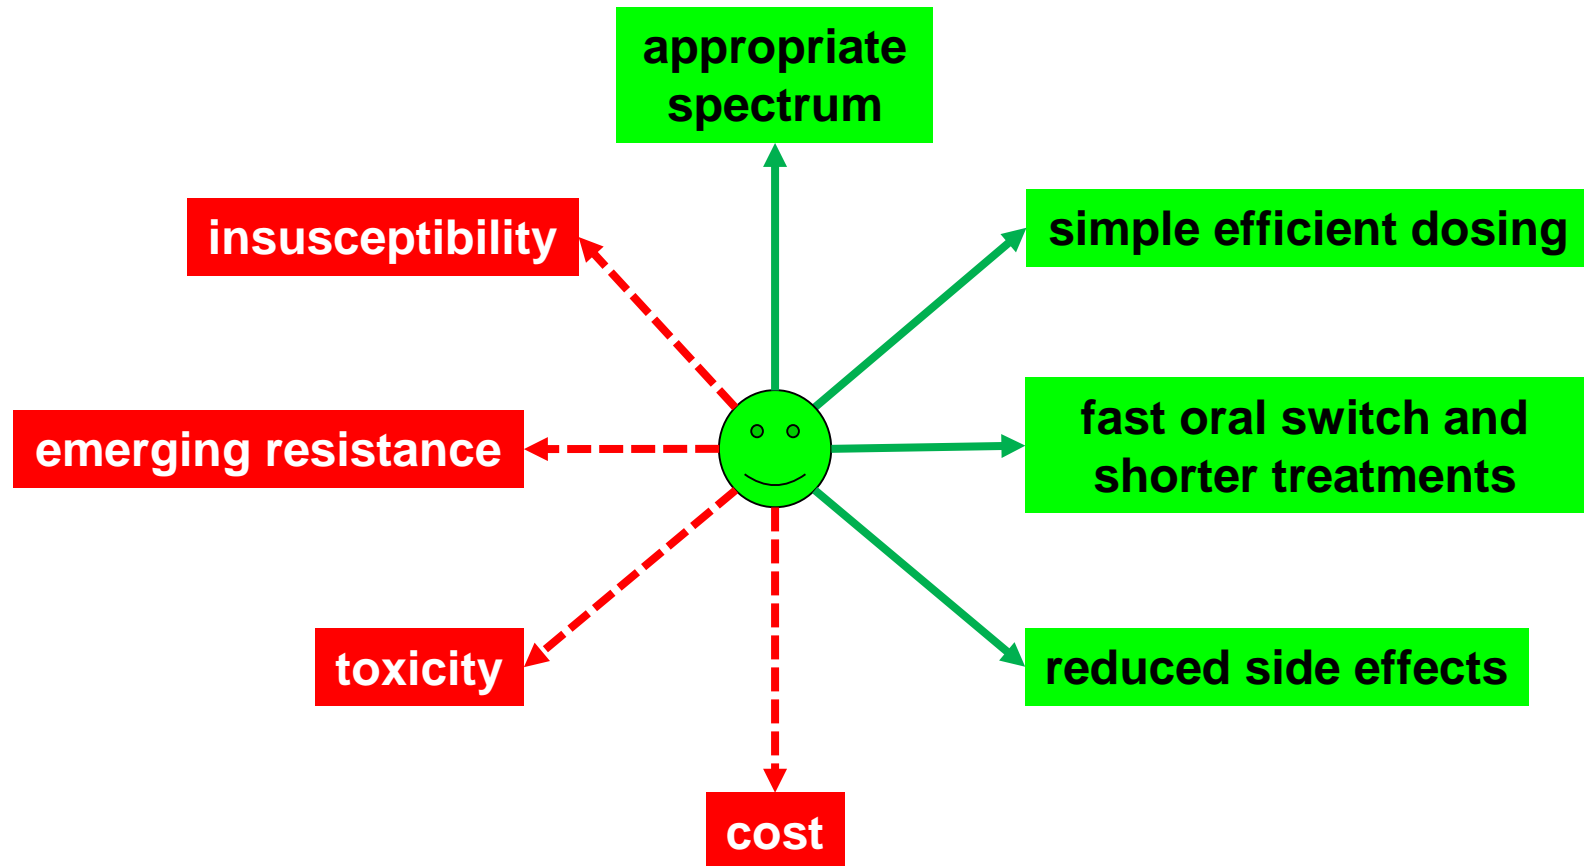

The treatment cost can be substantially reduced with an oral drug...
offsetting the increased drug acquisition cost (branded)

What you wish to avoid ...

A short personal view...

and what you may be looking for ...

A short personal view...

Last words: strive for quality *

Many antibiotics are available as generics !

For the patient

- lower cost
- availability

For Society

- Social Security savings

For the patient

- API purity ?
- excipients ?
- PK equivalence ?
- PD equivalence ?
- fake drugs !

For Society

- cost of analysis !
- innovation loss ?

API: Active Pharmaceutical Ingredient
PK: Pharmacokinetic
PD: Pharmacodynamic
