Pros and Cons of aminoglycosides

```
graph TD; Title[Pros and Cons of aminoglycosides] --> Pros[Pros]; Title --> Cons[Cons];
```

- High potency
- Concentration-dependent killing
- Synergy with β -lactams
- Cheap

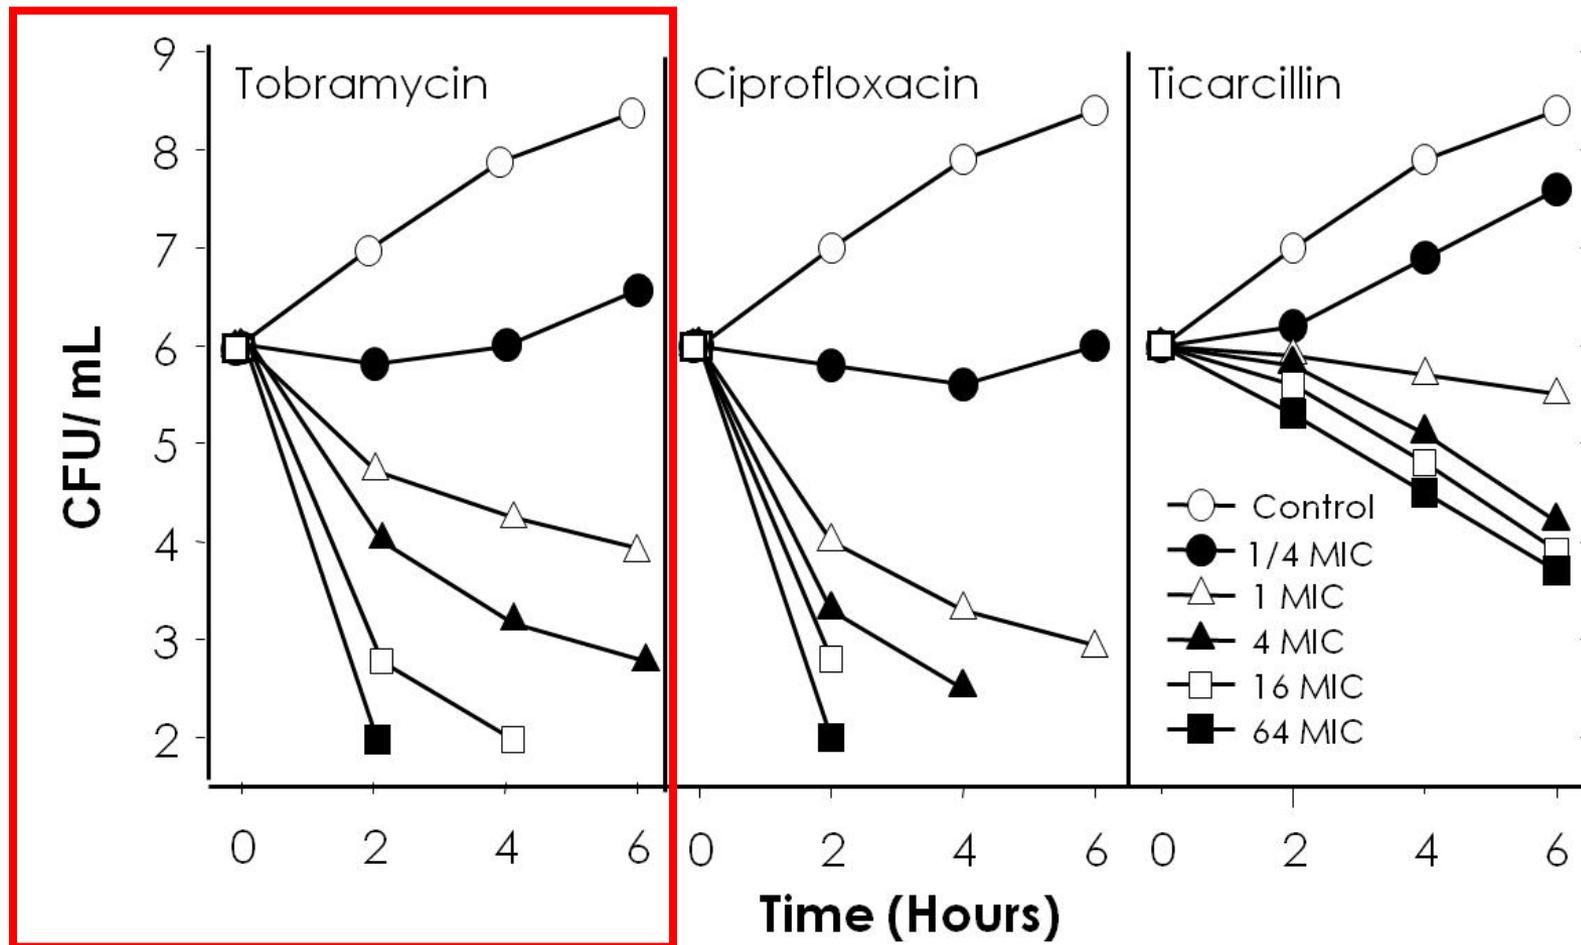

- Perception of poor efficacy in some circumstances
- Nephrotoxicity
- Ototoxicity

Both efficacy and safety can be improved by appropriate dosing !

1. optimizing efficacy based on PK-PD

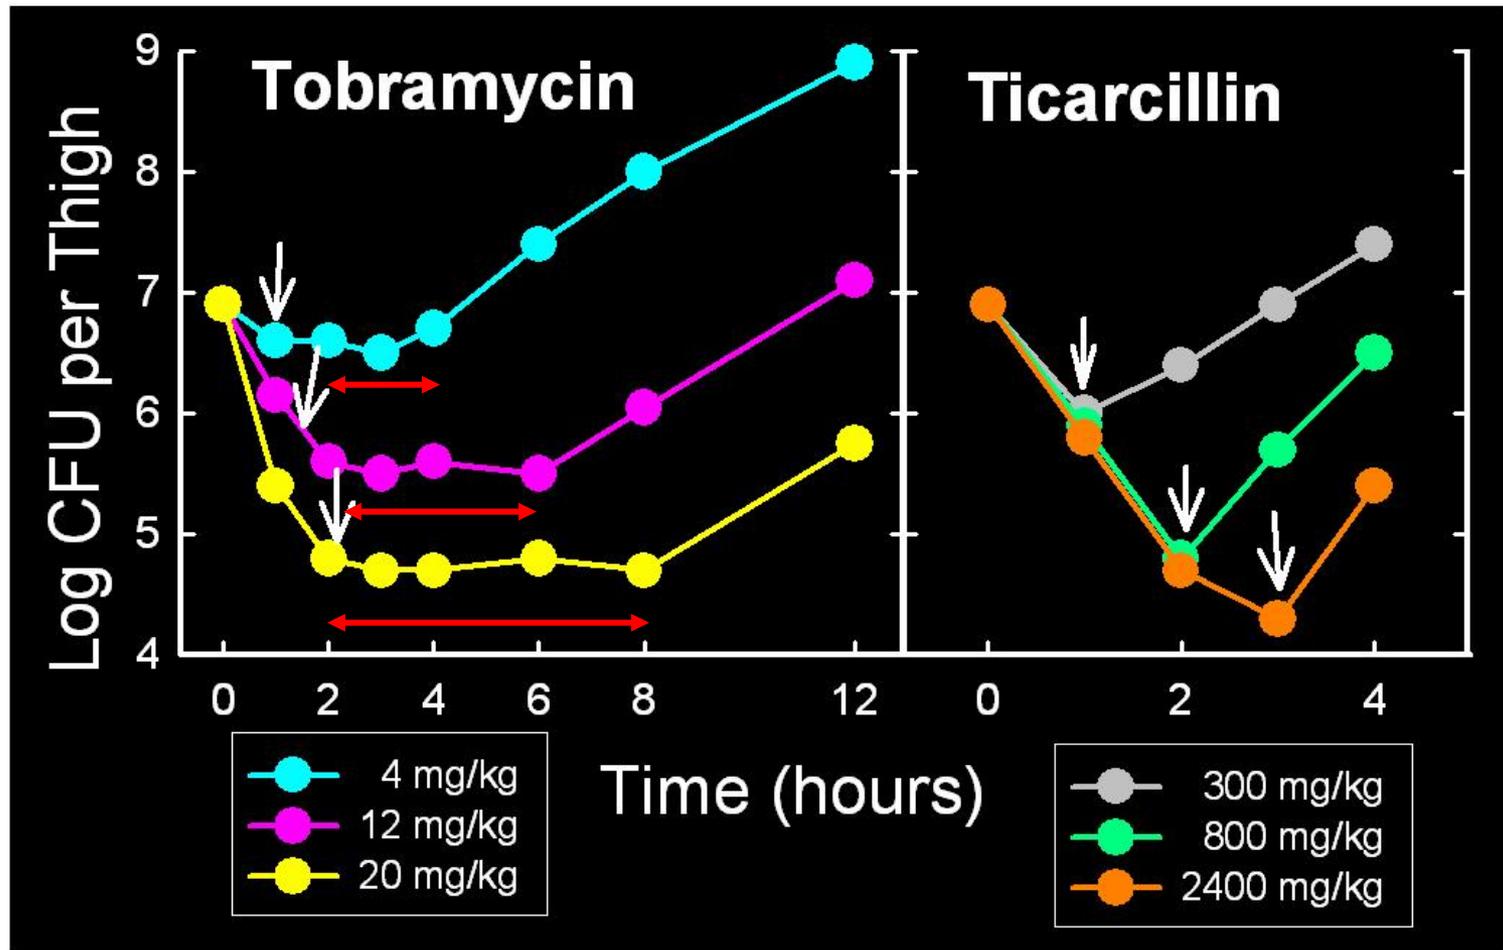

In vitro time-kill curves

Time and conc. – dependent killing

Craig WA, Ebert SC.. *Scand J Infect Dis Suppl* 1990; 74:63–70.

In vitro post-antibiotic effect

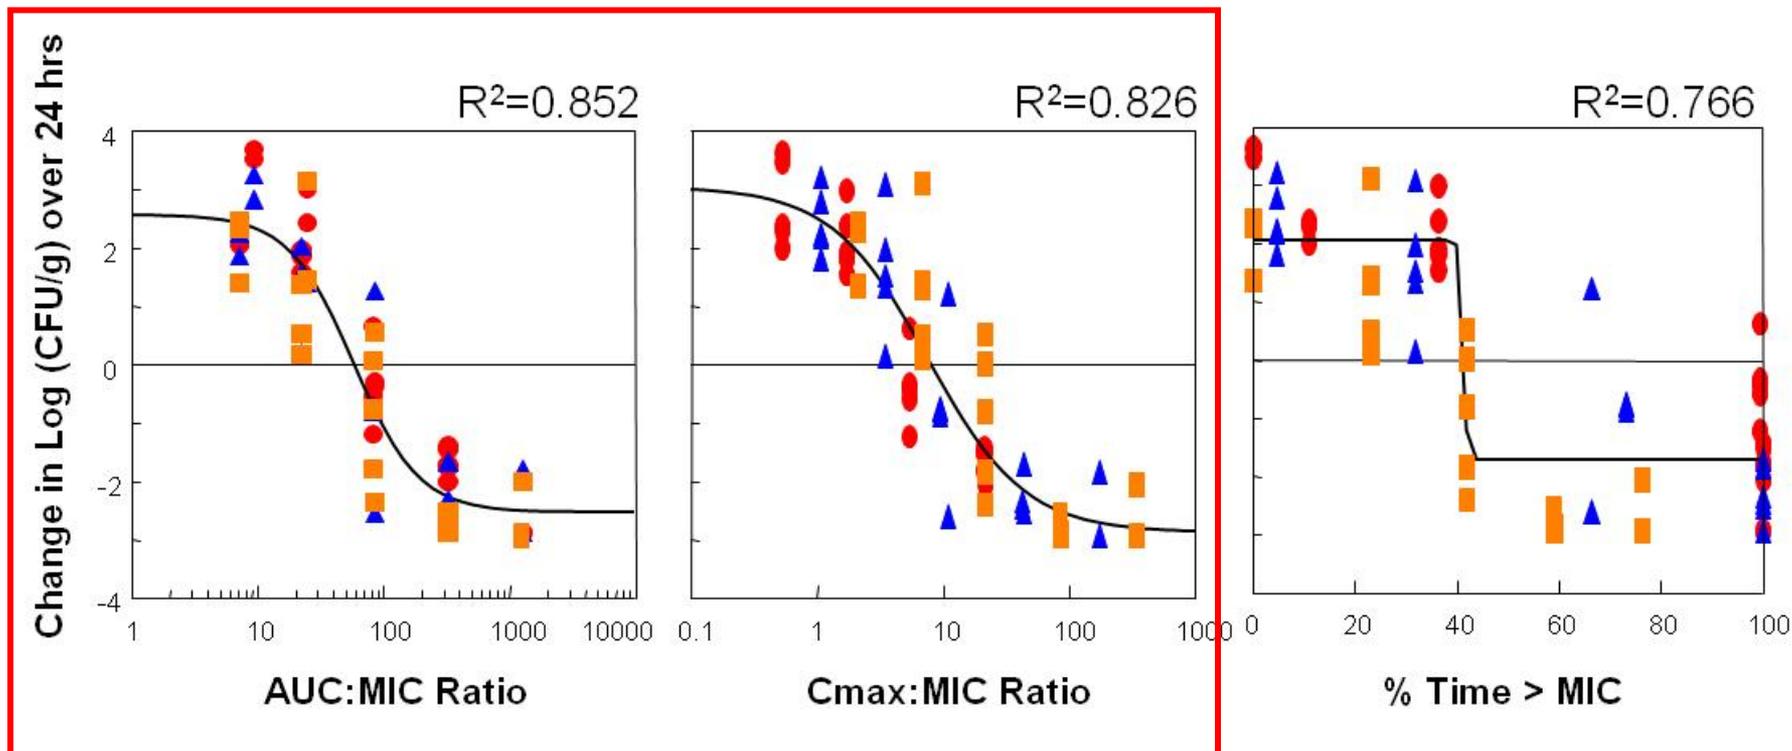

delay before regrowth

Vogelman et al. *J Infect Dis.* 1988 157:287-298

Animal PD model

Amikacin versus Gram-Negative Bacilli: efficacy

● Q 6 hr ▲ Q 12 hr ■ Q 24 hr ◆ Control

both AUC_{24h}:MIC and C_{max}:MIC dependent killing !

Neutropenic mice were inoculated with 10⁶ CFU/thigh of either *P. aeruginosa* (MIC = 4 mg/L) or *S. marcescens* (MIC = 8 mg/L)

Craig et al. IDSA, 2006.

Animal PD model

Amikacin versus Gram-Negative Bacilli: PK-PD attainment rate

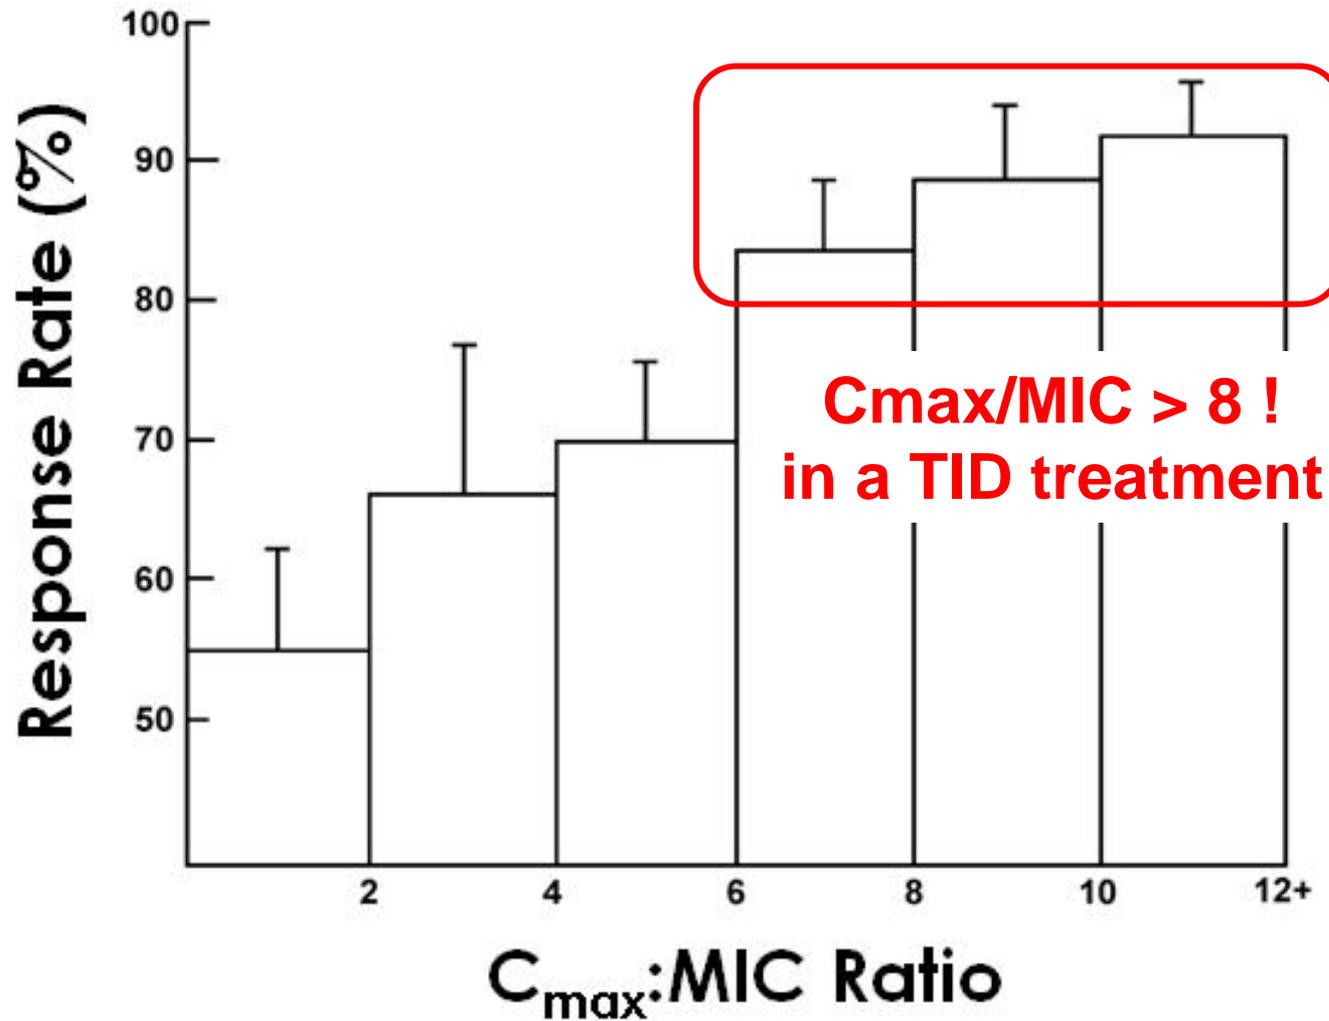

MIC (mg/L)	Dosing Regimen			
	15 mg/kg/day		30 mg/kg/day	
	PK-PD Target ¹			
	AUC:MIC = 59	AUC:MIC = 96	AUC:MIC = 59	AUC:MIC = 96
0.5	100	100	100	100
1	99.9	94.8	100	100
2	85.7	42.8	99.8	94.6
4	23.7	2.5	85.6	42.4
8	0.72	0	23.8	2.13

Craig et al. IDSA, 2006.

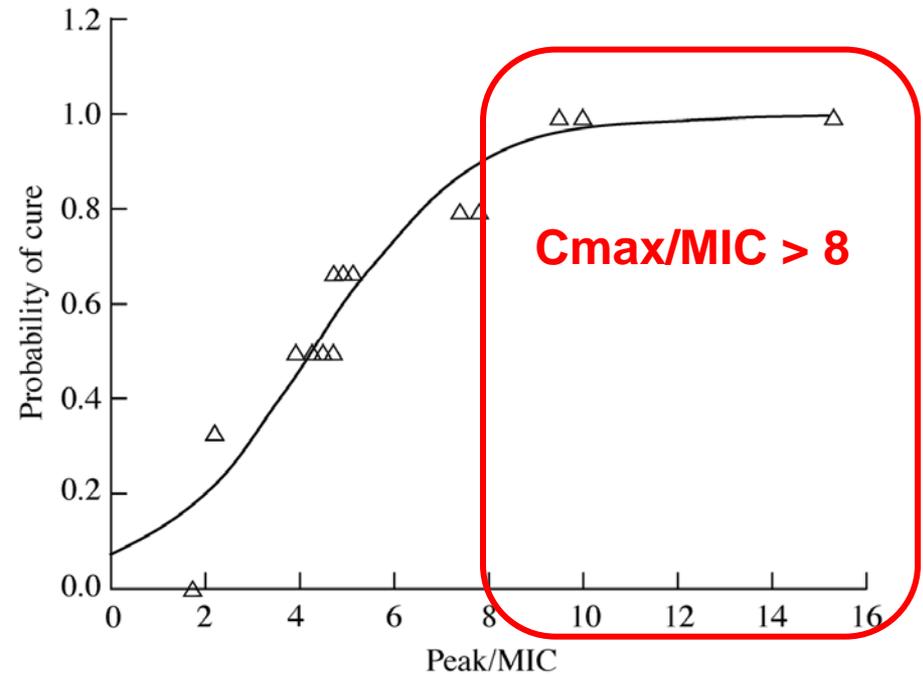

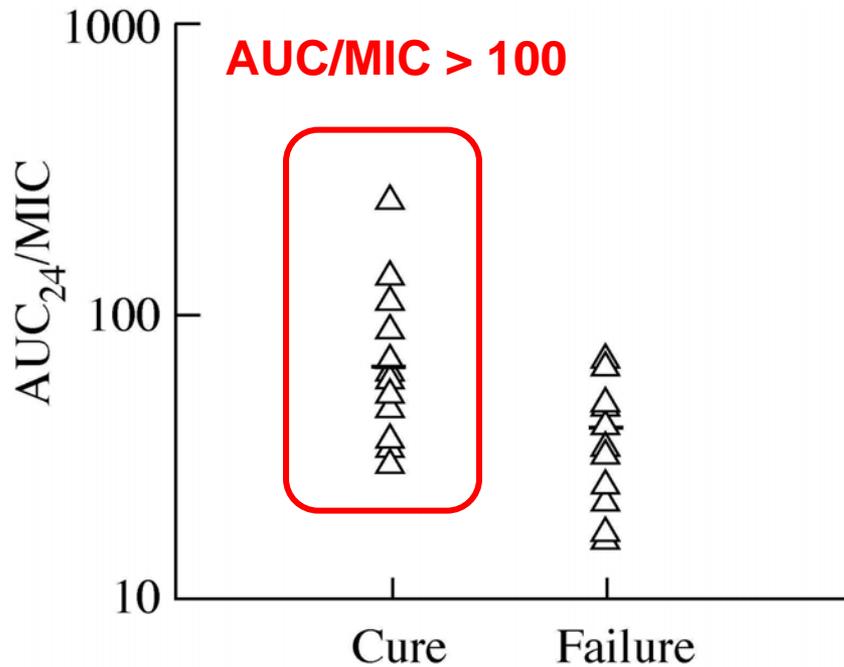

Concentration is important in patients also ...

Moore RD, Lietman PS, Smith CR. *JID* 1987;155:93-99.

Concentration is important in patients also ...

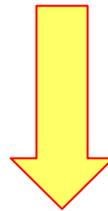

Gentamicin and *Pseudomonas* bacteriemia

Zelenitsky et al. JAC 2003; 52:668-674

What have we learned from models ?

- Aminoglycosides have a concentration-dependent pattern of bactericidal activity and prolonged persistent effects both *in vitro* and *in vivo*
- **PK-PD Goal** of dosing : **Maximize Concentrations!**

Optimize peak (and AUC)

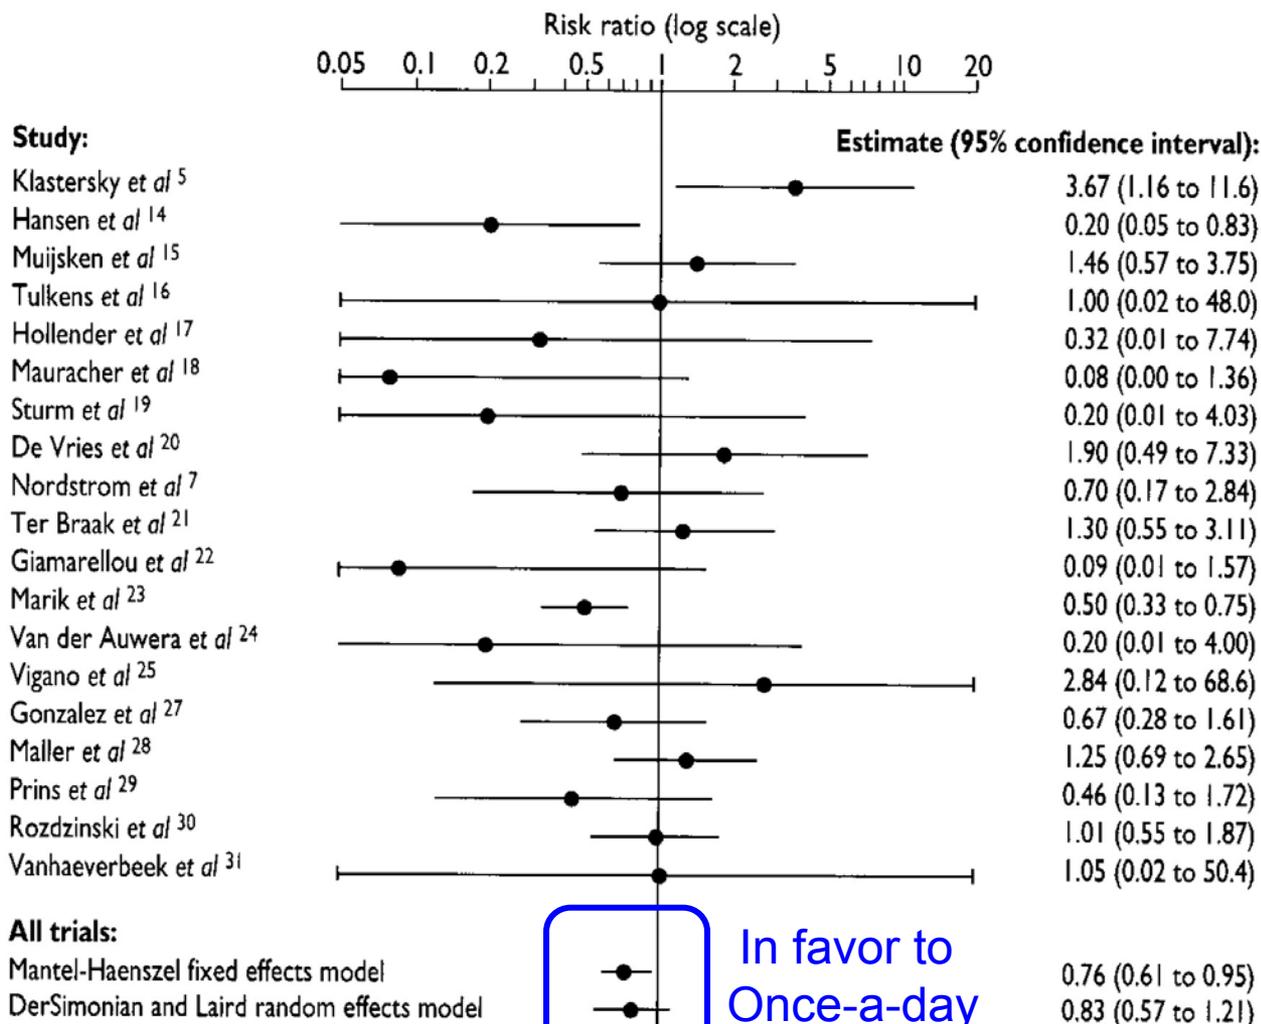

**Once-a-day
administration !**

Meta-analysis : Once-daily dosing has a lower risk of clinical failure

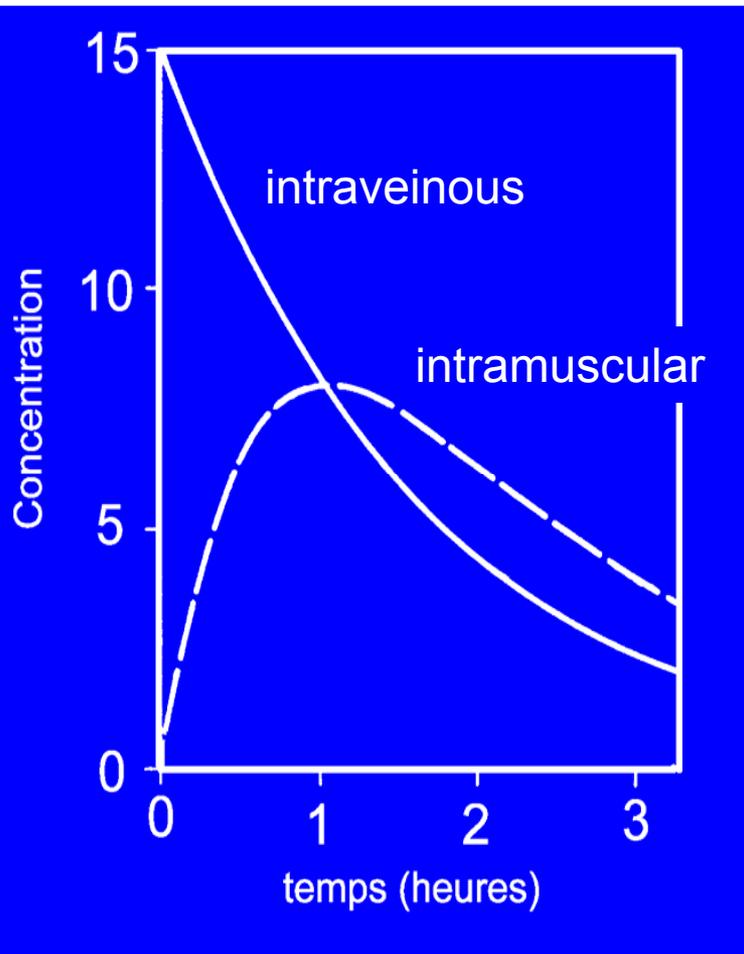

Favors once-a-day Favors multiple dose

Barza *et al*, *BMJ* 1996; 312:338-344

Dosing once-a-day in practice

Peak/MIC > 8

1. adequate mode of administration

➔ **i.v. administration**

2. calculate the peak you need

➔ **minimal peak = MIC x 8**

3. calculate the dose you need

$$\text{peak} = \text{dose} / V_d$$

➔ **dose = peak x V_d**

Finding the appropriate dose ...

increase the unit dose to get the appropriate peak !

MIC = 1 mg/L \Rightarrow C_{\max} = 8 mg/L \Rightarrow 3 mg/kg

MIC = 2 mg/L \Rightarrow C_{\max} = 16 mg/L \Rightarrow 6 mg/kg \leftarrow **limit of G, T, N ??**

MIC = 4 mg/L \Rightarrow C_{\max} = 32 mg/L \Rightarrow 15 mg/kg \leftarrow **limit of A, I ??**

Setting up the limits of efficacy

Aminoglycosides 1st two rules of thumb...

anything with an MIC $< 1 \mu\text{g/ml}$ will be treatable if in the indications...

- efficacy may become a problem for MIC's
- $> 2 \mu\text{g/ml}$ for G, T, N (up to 6 mg/kg)
 - $> 4 \mu\text{g/ml}$ for A, I (up to 15 mg/kg)

PK / PD “safe” breakpoints for AG

- G, N, T : $2 \mu\text{g / ml}$
- A / I : $4 \mu\text{g / ml}$

Setting up the limits of efficacy

Aminoglycosides EUCAST breakpoints

Enterobacteriaceae EUCAST Clinical Breakpoint Table v. 1.3 2011-01-05

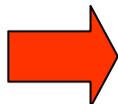

Aminoglycosides ¹	MIC breakpoint (mg/L)		Disk content (µg)	Zone diameter breakpoint (mm)	
	S ≤	R >		S ≥	R <
Amikacin	8	16	30	16	13
Gentamicin	2	4	10	17	14
Netilmicin	2	4	10	15	12
Tobramycin	2	4	10	16	13

Notes

Numbers for comments on MIC breakpoints

Letters for comments on disk diffusion

1. Aminoglycoside breakpoints are based on once-daily administration of high aminoglycoside dosages. Most often aminoglycosides are given in combination with beta-lactam agents.

Setting up the limits of efficacy

Aminoglycosides EUCAST breakpoints

Enterobacteriaceae EUCAST Clinical Breakpoint Table v. 1.3 2011-01-05

Aminoglycosides ¹	MIC breakpoint (mg/L)		Disk content (µg)	Zone diameter breakpoint (mm)	
	S ≤	R >		S ≥	R <
Amikacin	8	16	30	16	13
Gentamicin	2	4	10	17	14
Netilmicin	2	4	10	15	12
Tobramycin	2	4	10	16	13

Notes

Numbers for comments on MIC breakpoints

Letters for comments on disk diffusion

1. Aminoglycoside breakpoints are based on once-daily administration of 15 mg/kg. Aminoglycosides are given in combination with beta-lactam agents.

amikacin may be given at very high doses reasonably safely

Setting up the limits of efficacy

Aminoglycosides EUCAST breakpoints

Pseudomonas spp.

Aminoglycosides ¹	MIC breakpoint (mg/L)		Disk content (µg)	Zone diameter breakpoint (mm)	
	S ≤	R >		S ≥	R <

Tobramycin	4	4	10	16	16

Notes

Numbers for comments on MIC breakpoints

Letters for comments on disk diffusion

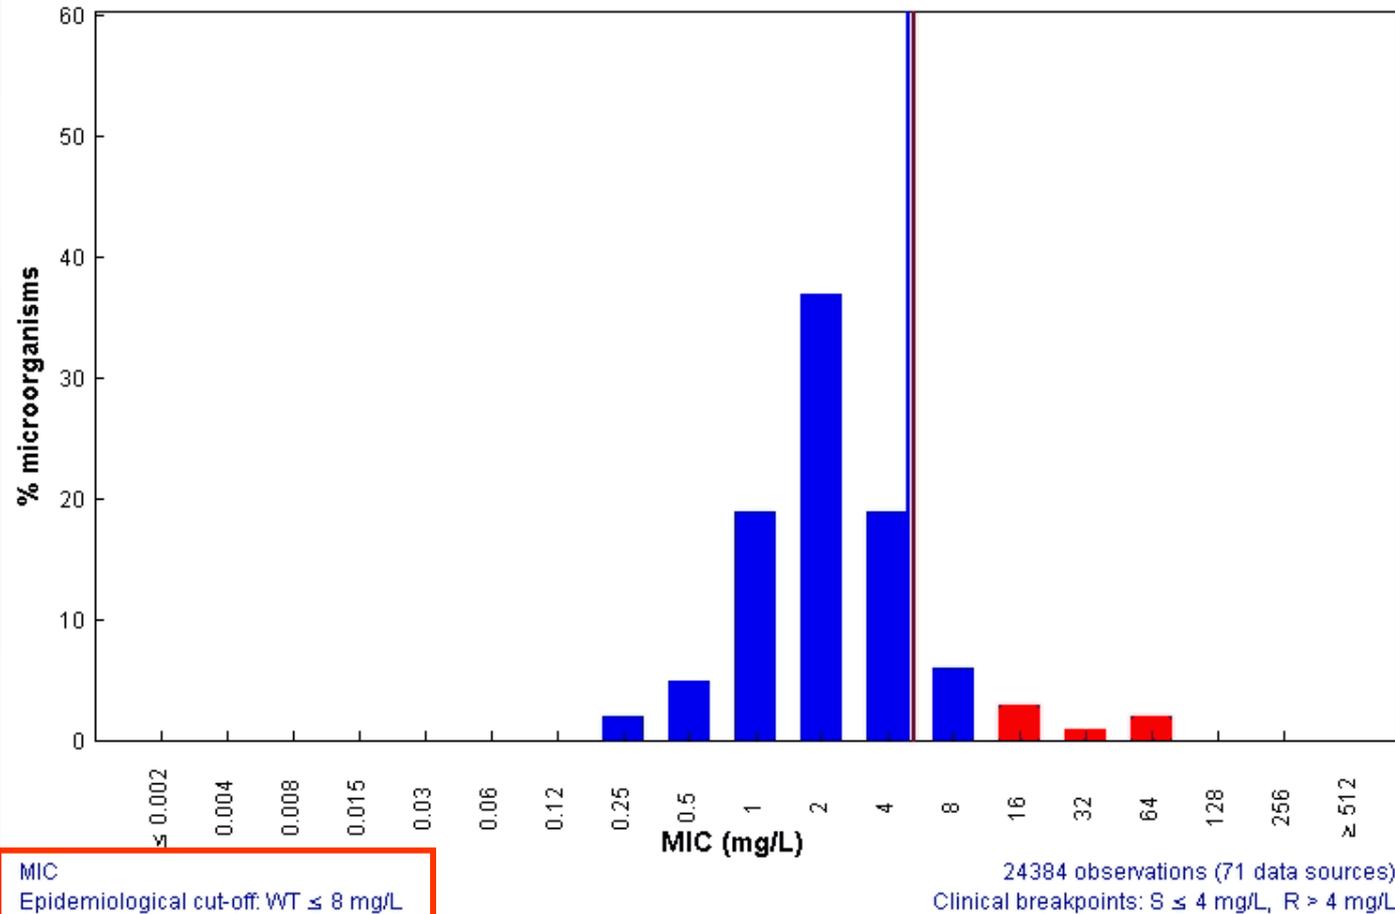

1. Aminoglycoside breakpoints are based on once-daily administration of aminoglycosides are given in combination with beta-lactam agents.

This is to avoid splitting the wild type population in two

EUCAST MIC distributions

Gentamicin / *Pseudomonas aeruginosa* EUCAST MIC Distribution - Reference Database 2011-10-03

MIC distributions include collated data from multiple sources, geographical areas and time periods and can never be used to infer rates of resistance

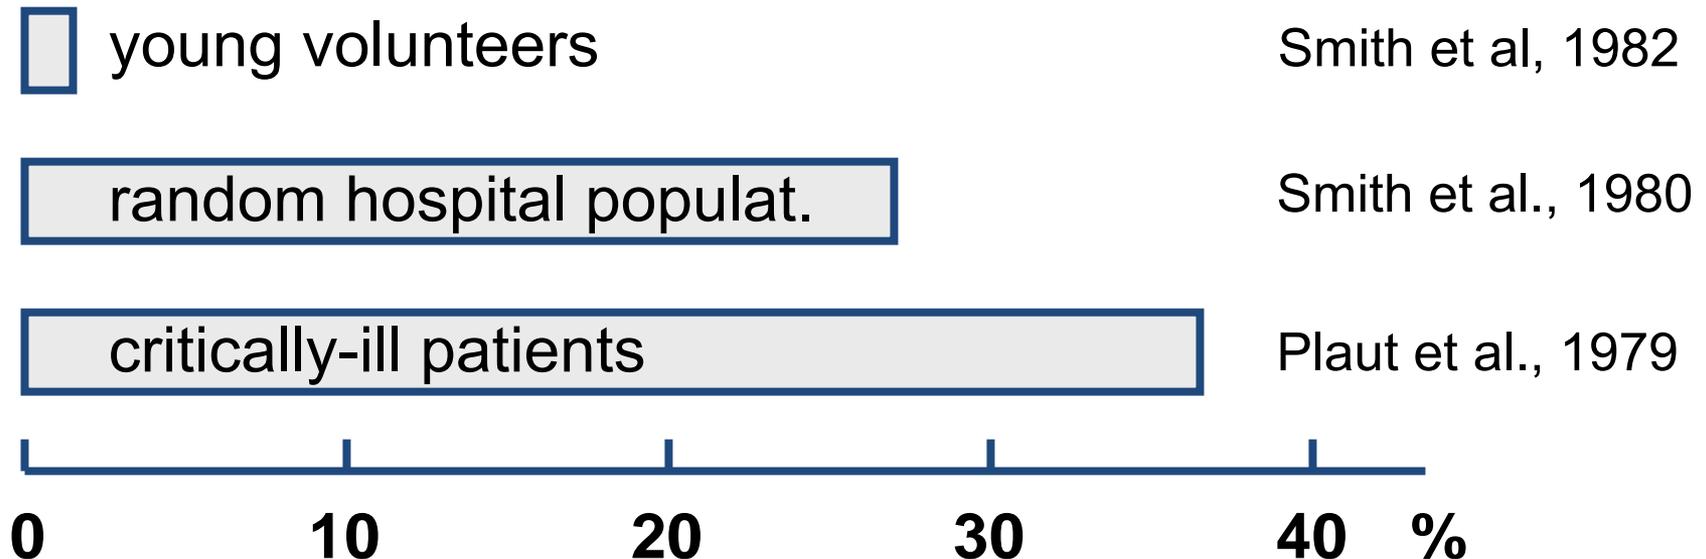

2. Reducing toxicity based on PK-PD

The goal is to avoid toxicity while preserving efficacy !

Aminoglycosides nephrotoxicity incidence is highly variable among patient populations

Patients with nephrotoxic reaction after treatment with gentamicin

High doses in animals cause renal necrosis, tubular dysfunction, and renal failure associated with regeneration

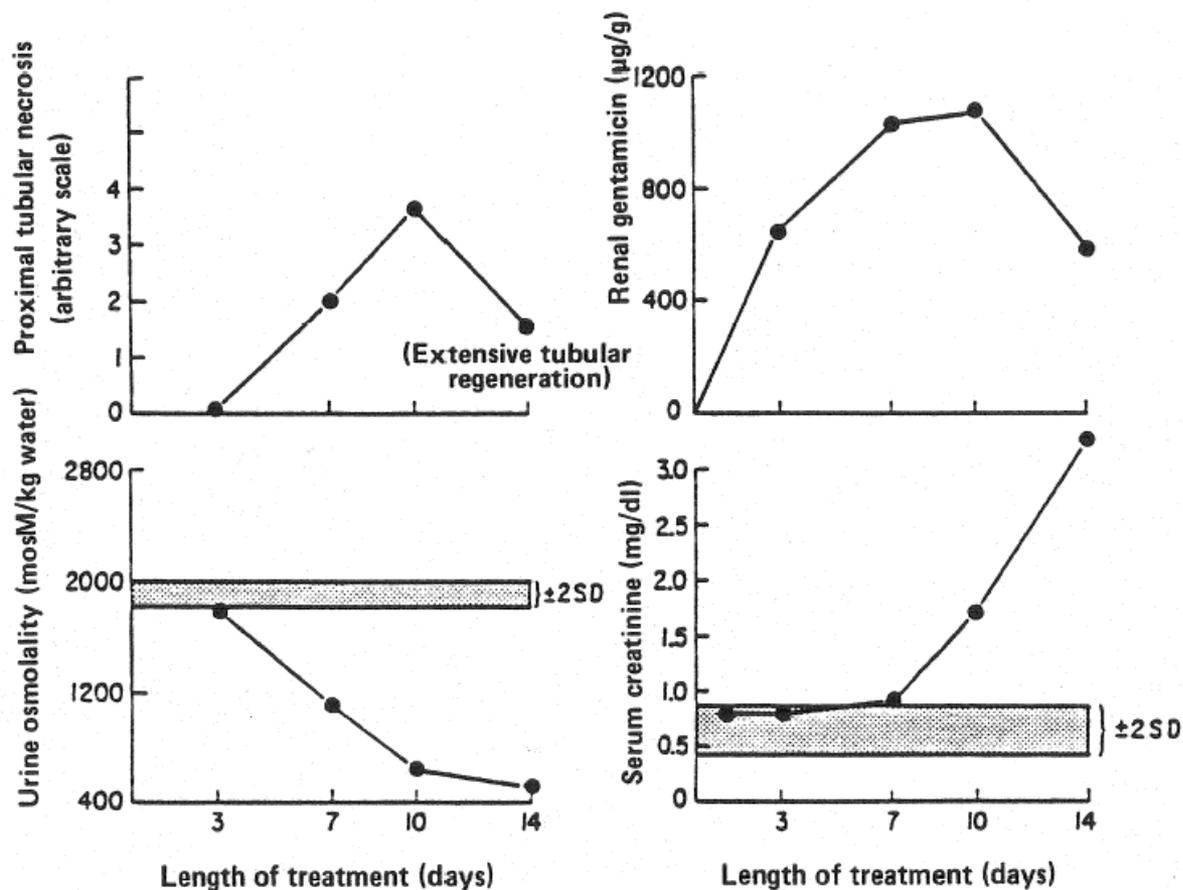

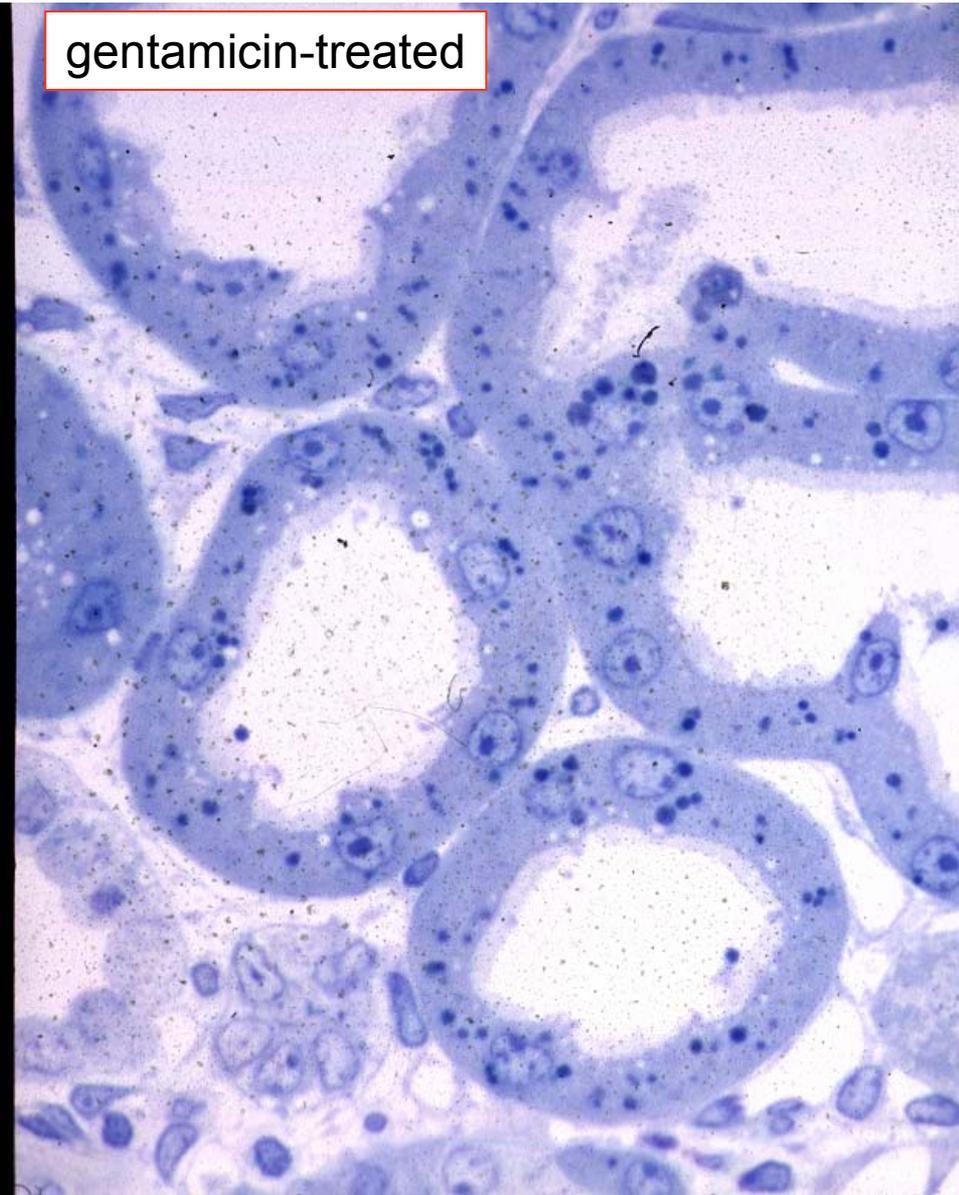

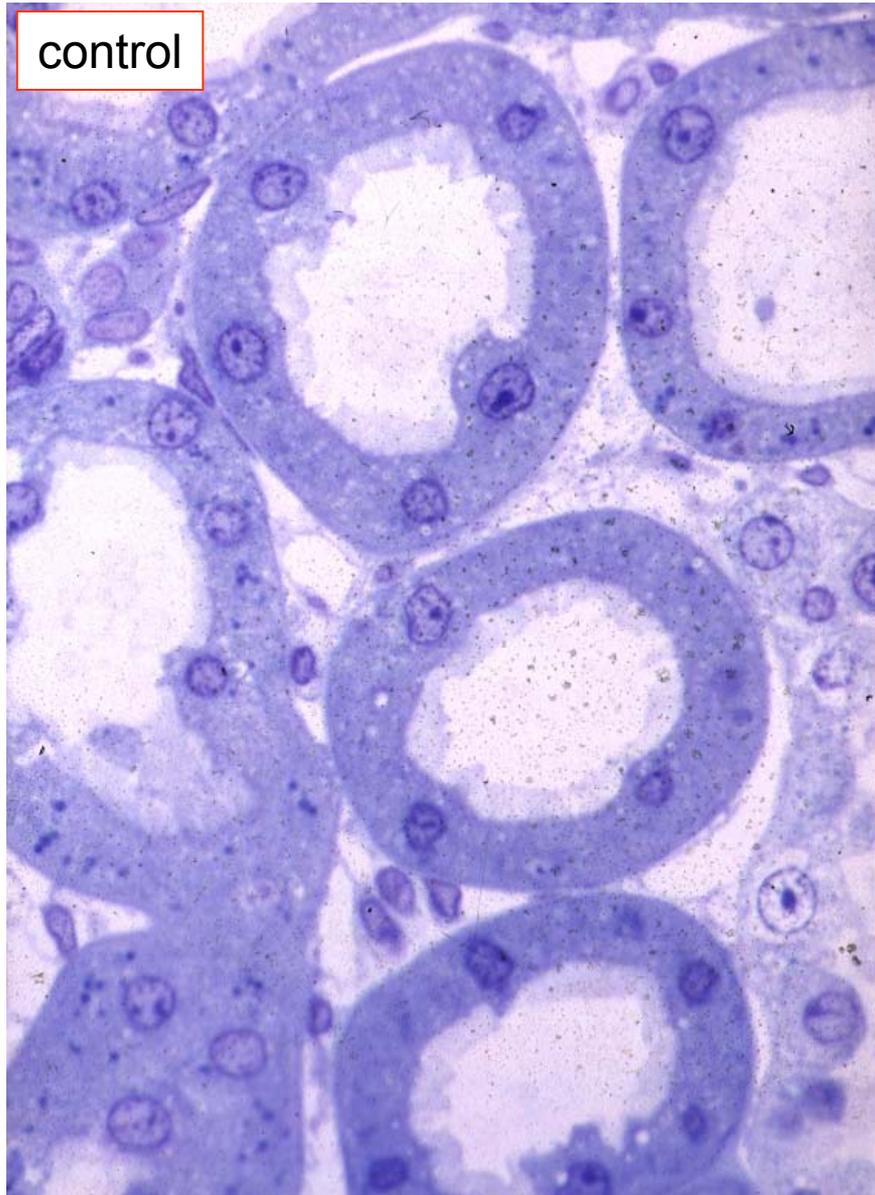

Fig. 1. Renal changes in Fischer 344 rats after gentamicin (40 mg/kg per day in two injections per day).

From Ref. 13.

What is the mechanism of gentamicin-induced apoptosis and its relation to necrosis in kidney cortex ?

Vol. 43, 1999

MINIREVIEWS 1005

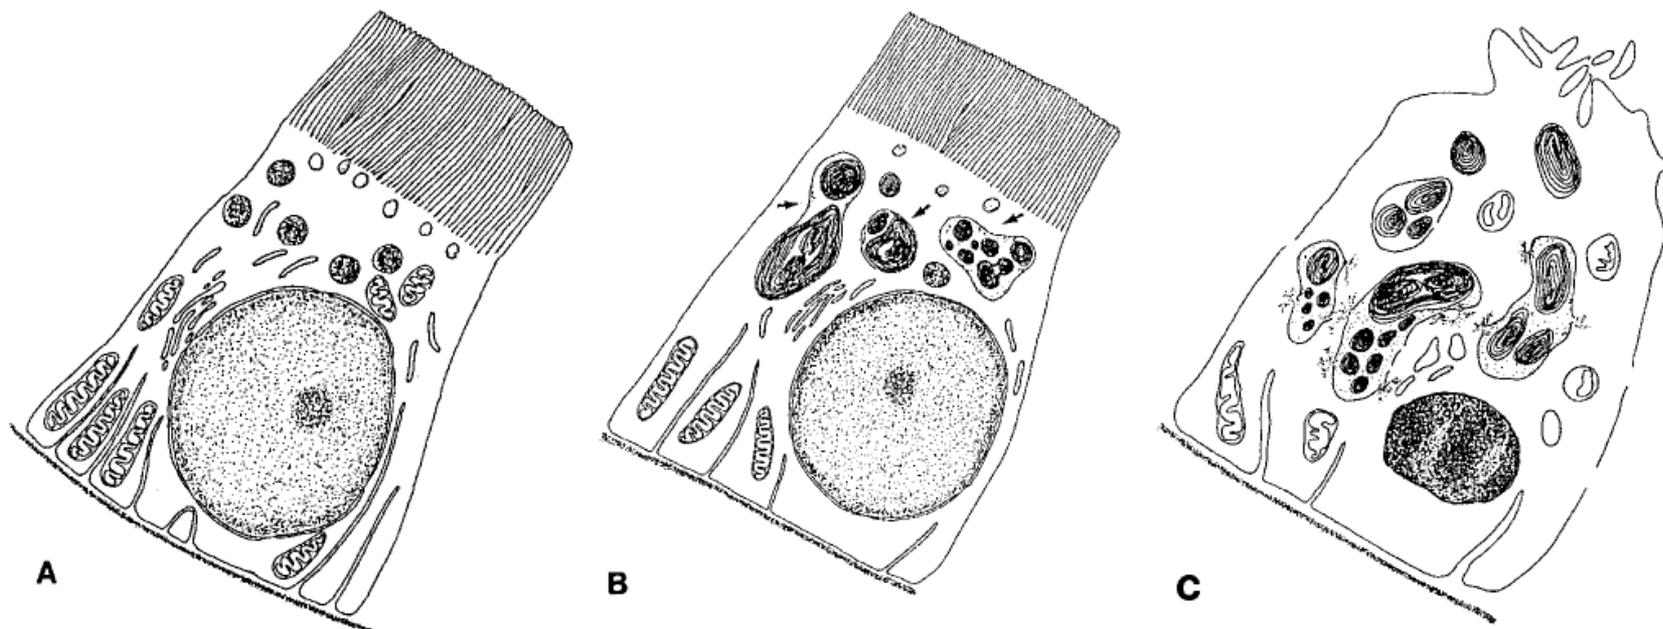

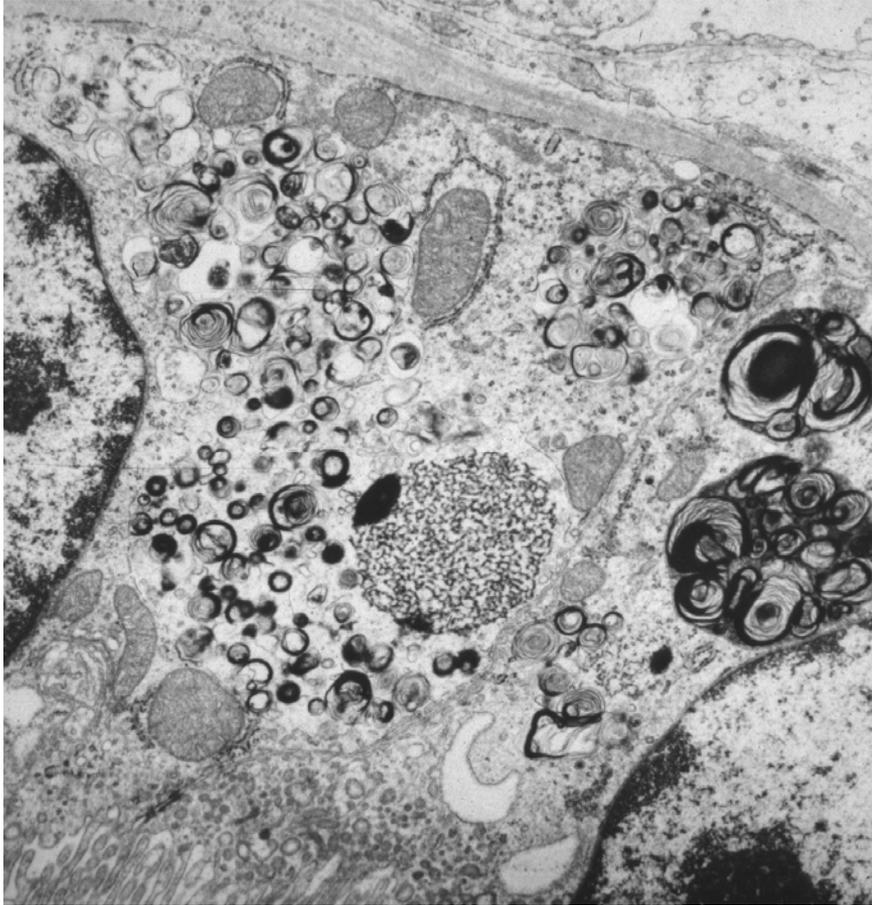

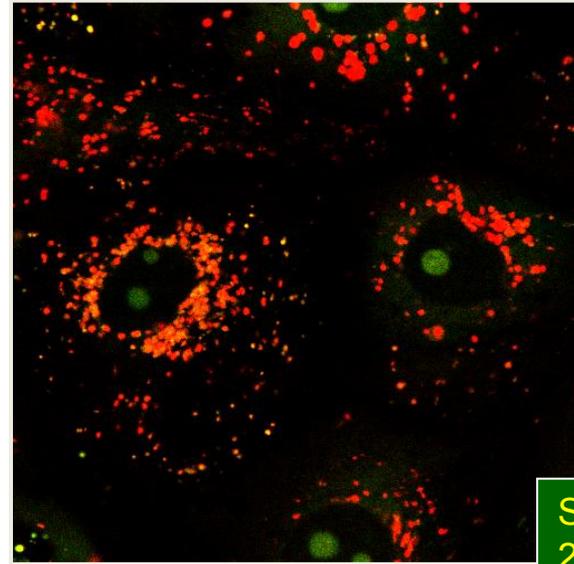

FIG. 1. Ultrastructural alterations induced in proximal tubular cells during aminoglycoside treatment. (A) Control. Changes detected early on and at low doses (B) consist mainly of the enlargement of lysosomes, which most likely occurs by fusion of preexisting structures and which is caused by the progressive deposition of polar lipids which adopt a concentric lamellar disposition (myelin-like structures, most commonly referred to as *myeloid bodies*); the other subcellular structures are usually well preserved. Later changes or changes observed with high doses (C) include the apparent rupture of lysosomes (with the release of myeloid bodies in the cytosol), extensive mitochondrial swelling and damage, dilatation of the endoplasmic reticulum cisternae, shedding of the apical brush-border villi, pericellular membrane discontinuities, and the occurrence of apoptotic nuclei. These alterations do not necessarily coexist in all cells. The figure is adapted from reference 76 and is based on the typical descriptions given in references 38, 40, 71, 76, 77, 127, and 138.

Mingeot-Leclercq & Tulkens, Antimicrob. Agents Chemother. (1999) 43:1003-1012

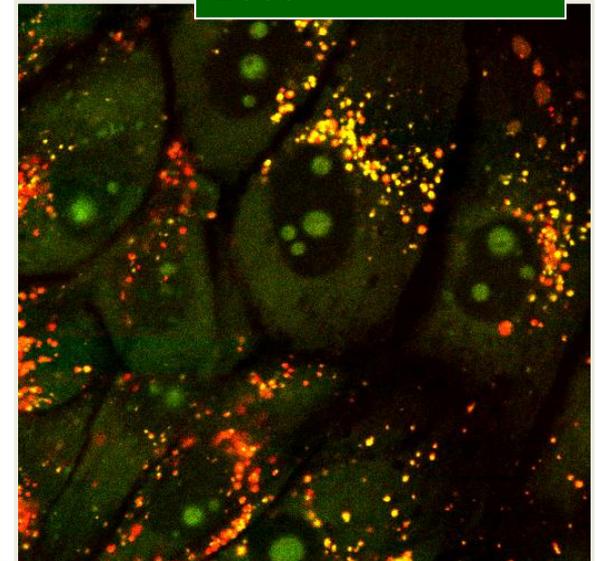

Could lysosomal rupture cause apoptosis and necrosis ?

Maldague et al., 1983

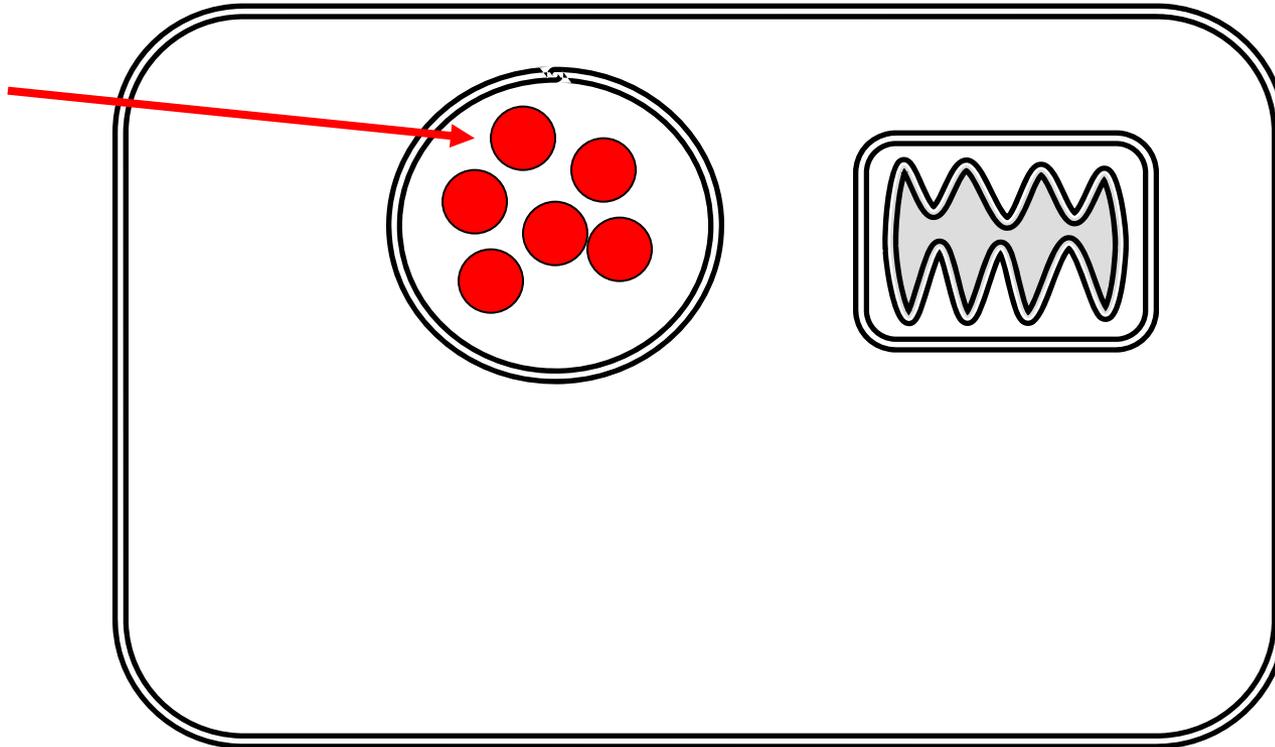

Servais et al.,
2006

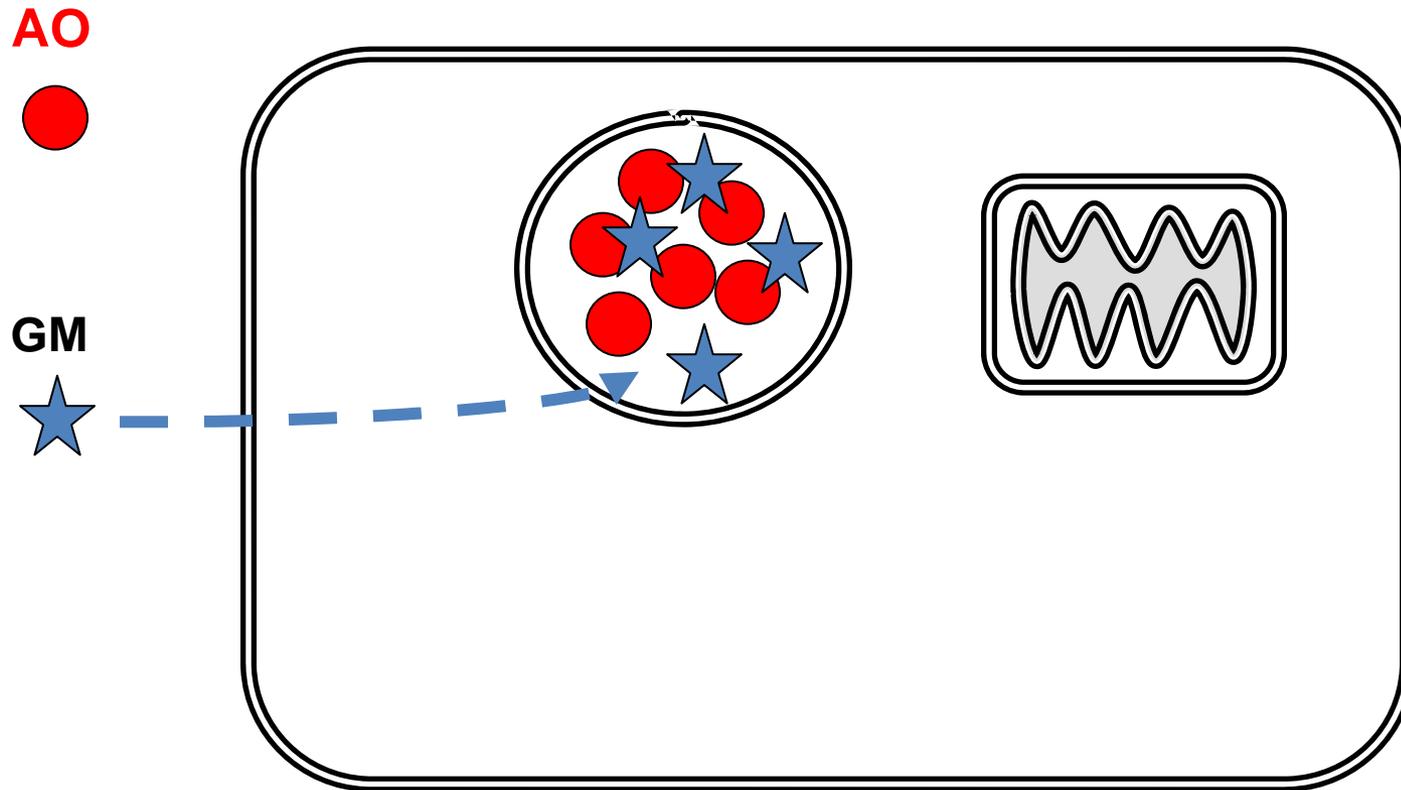

What Servais et al.'s experiment shows ... (1 of 3)

AO

AO diffuses and accumulates in lysosomes by proton trapping and becomes **red because it is concentrated and at acid pH**

What Servais et al.'s experiment shows ... (2 of 3)

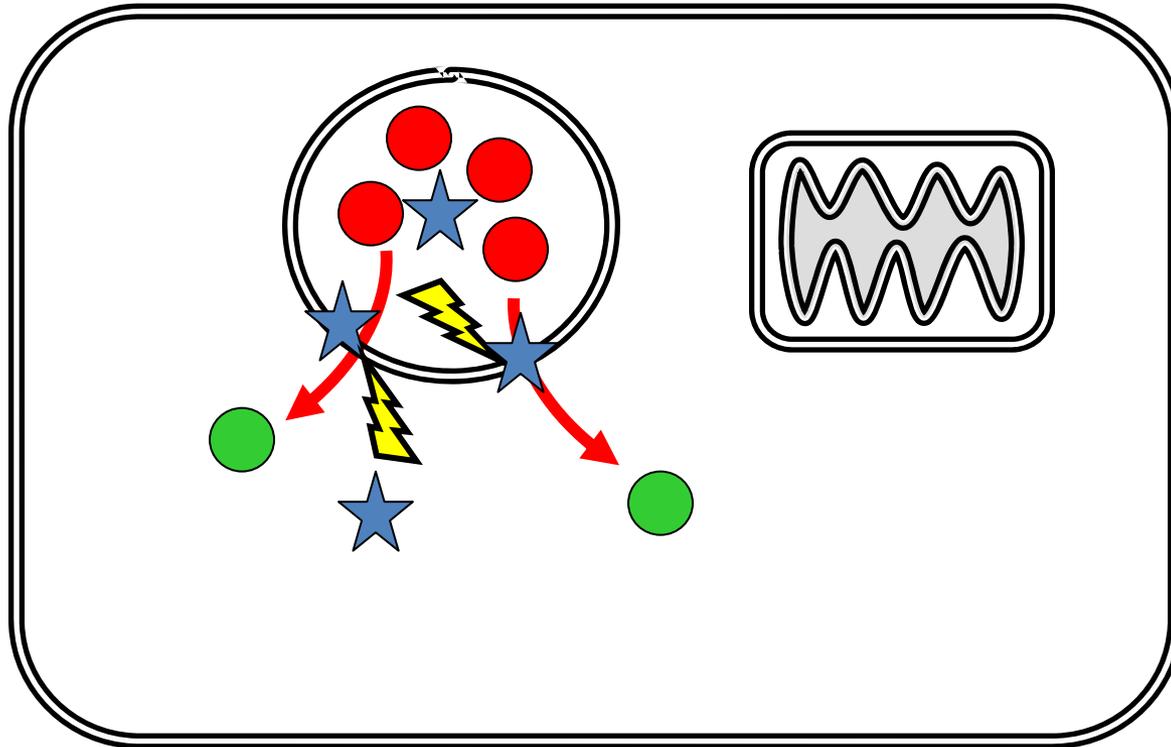

GM also accumulates in lysosomes but by pinocytosis

What Servais et al.'s experiment shows ... (3 of 3)

AO

GM

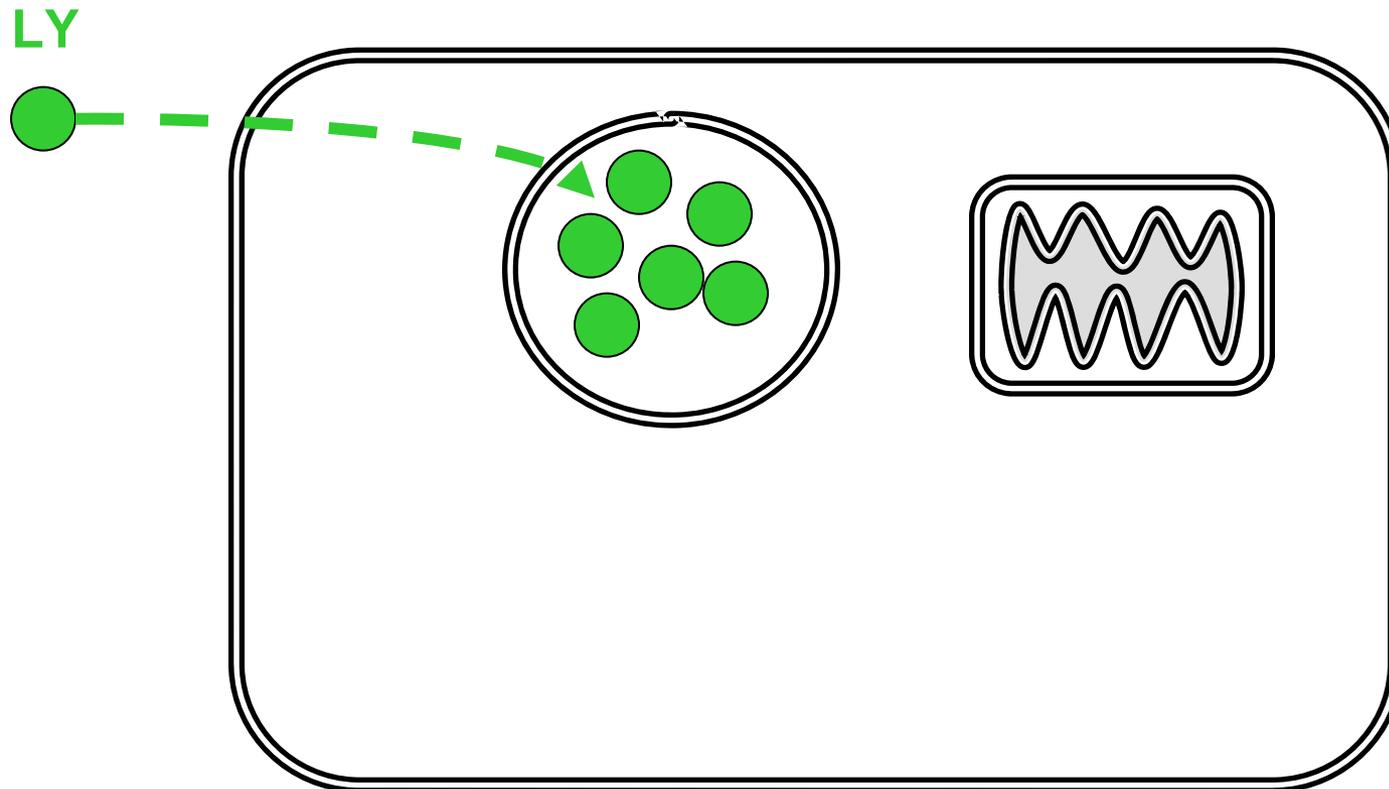

gentamicin induces a liberation of AO which turns green upon dilution and at lower pH

Is this membrane rupture or change of pH ?

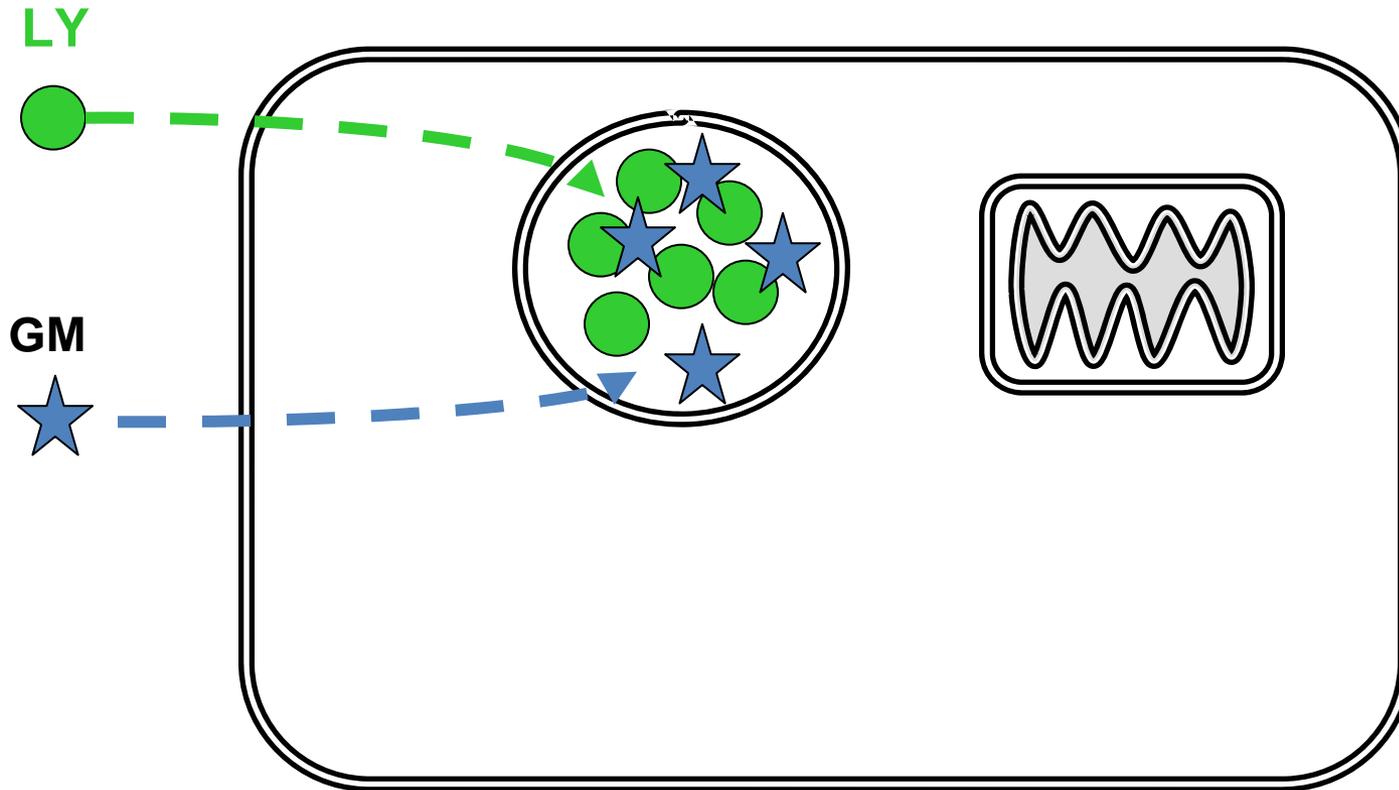

The recent demonstration of lysosomal rupture induced by gentamicin : use of Lucifer Yellow (1 of 5) *

LY accumulates in lysosomes by pinocytosis (non-diffusible) and is always green

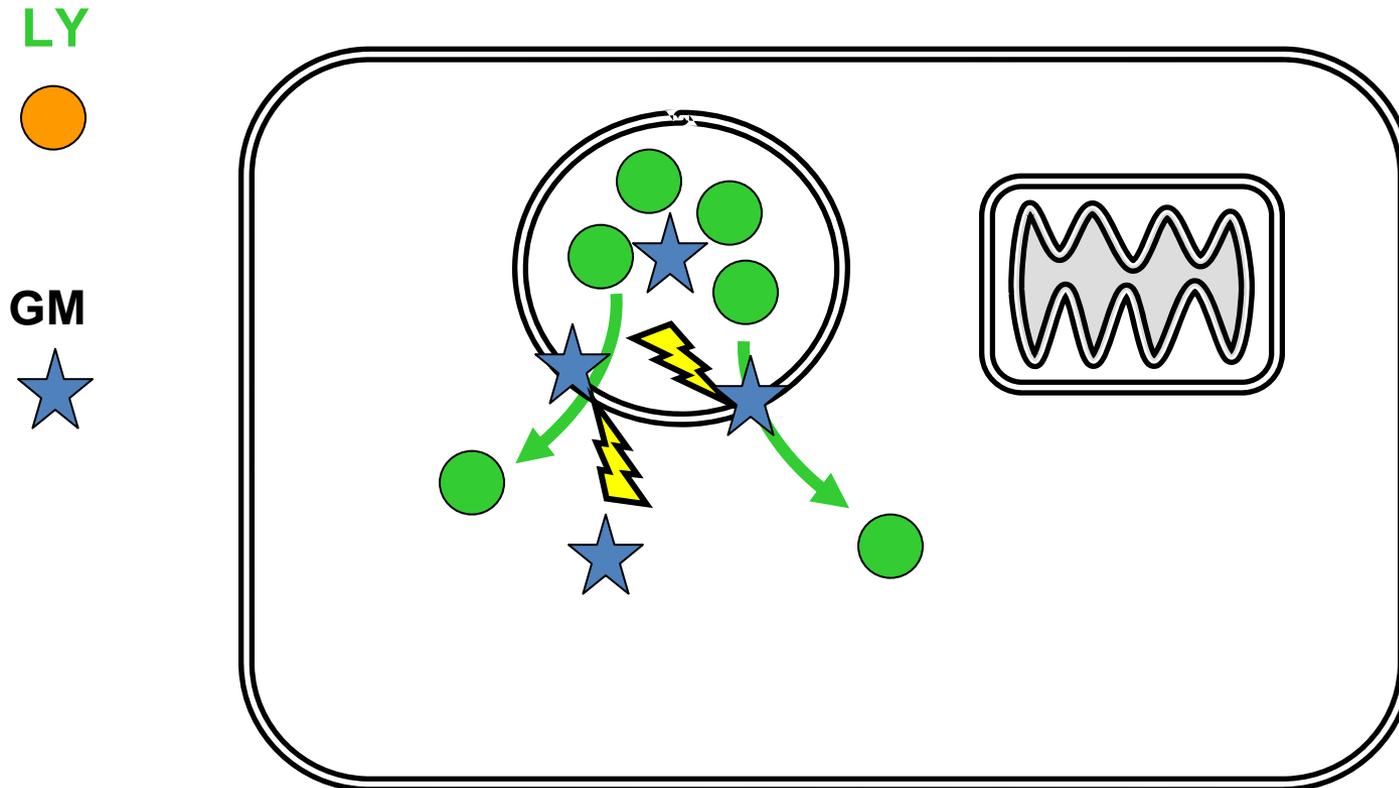

Denamur et al. Free Radic Biol Med. 2011 Jul 23.

The recent demonstration of lysosomal rupture induced by gentamicin : use of Lucifer Yellow (2 of 5)

GM also accumulates in lysosomes by pinocytosis as LY

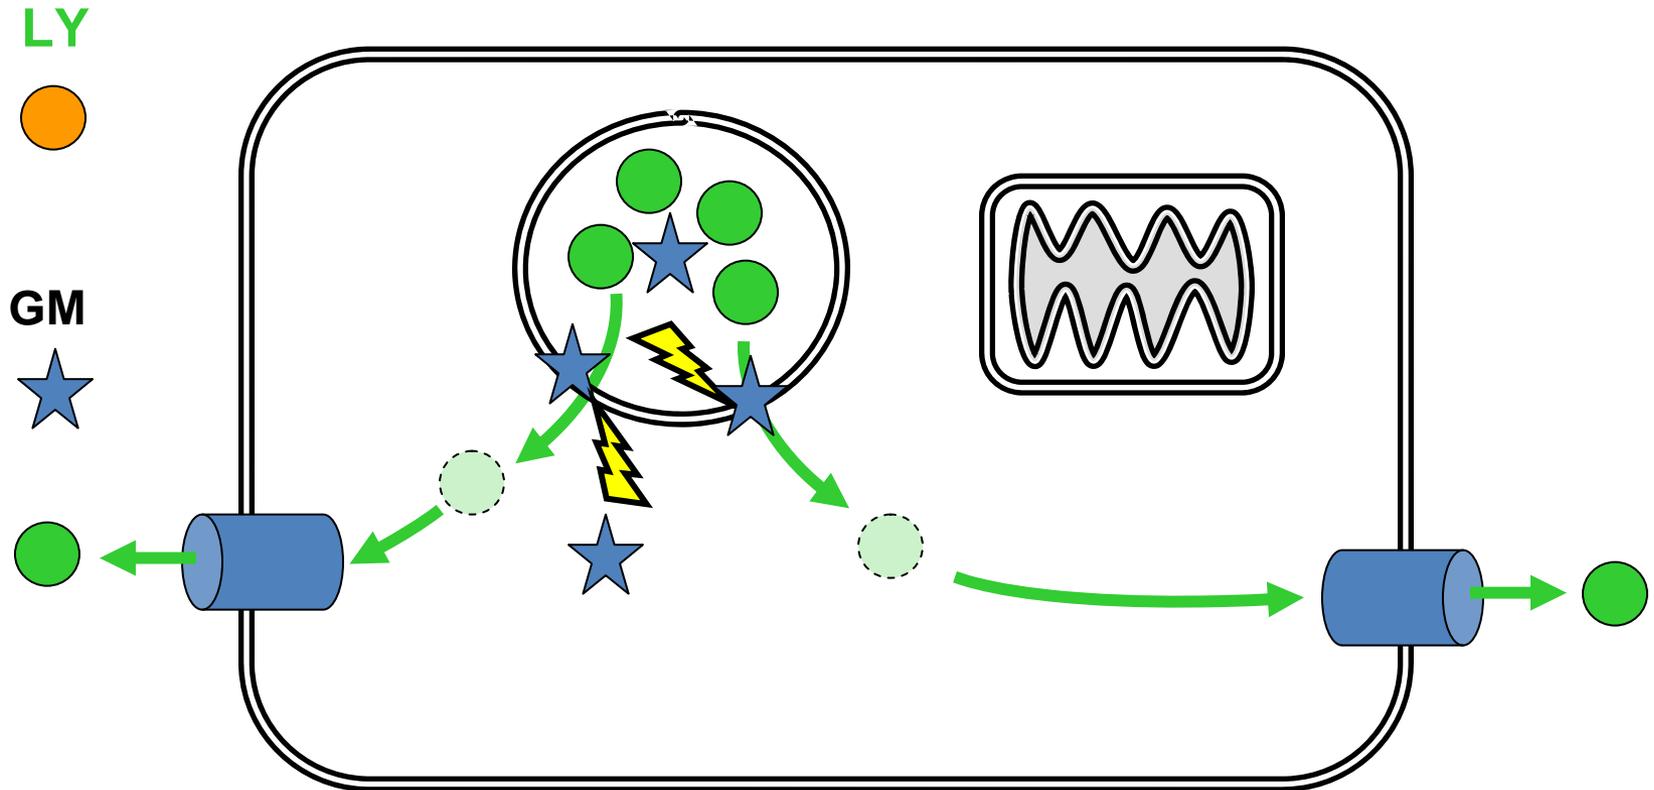

The recent demonstration of lysosomal rupture induced by gentamicin : use of Lucifer Yellow (3 of 5)

gentamicin induces the liberation of LY which can only occur if membrane is damaged (non-diffusible; no effect of pH)

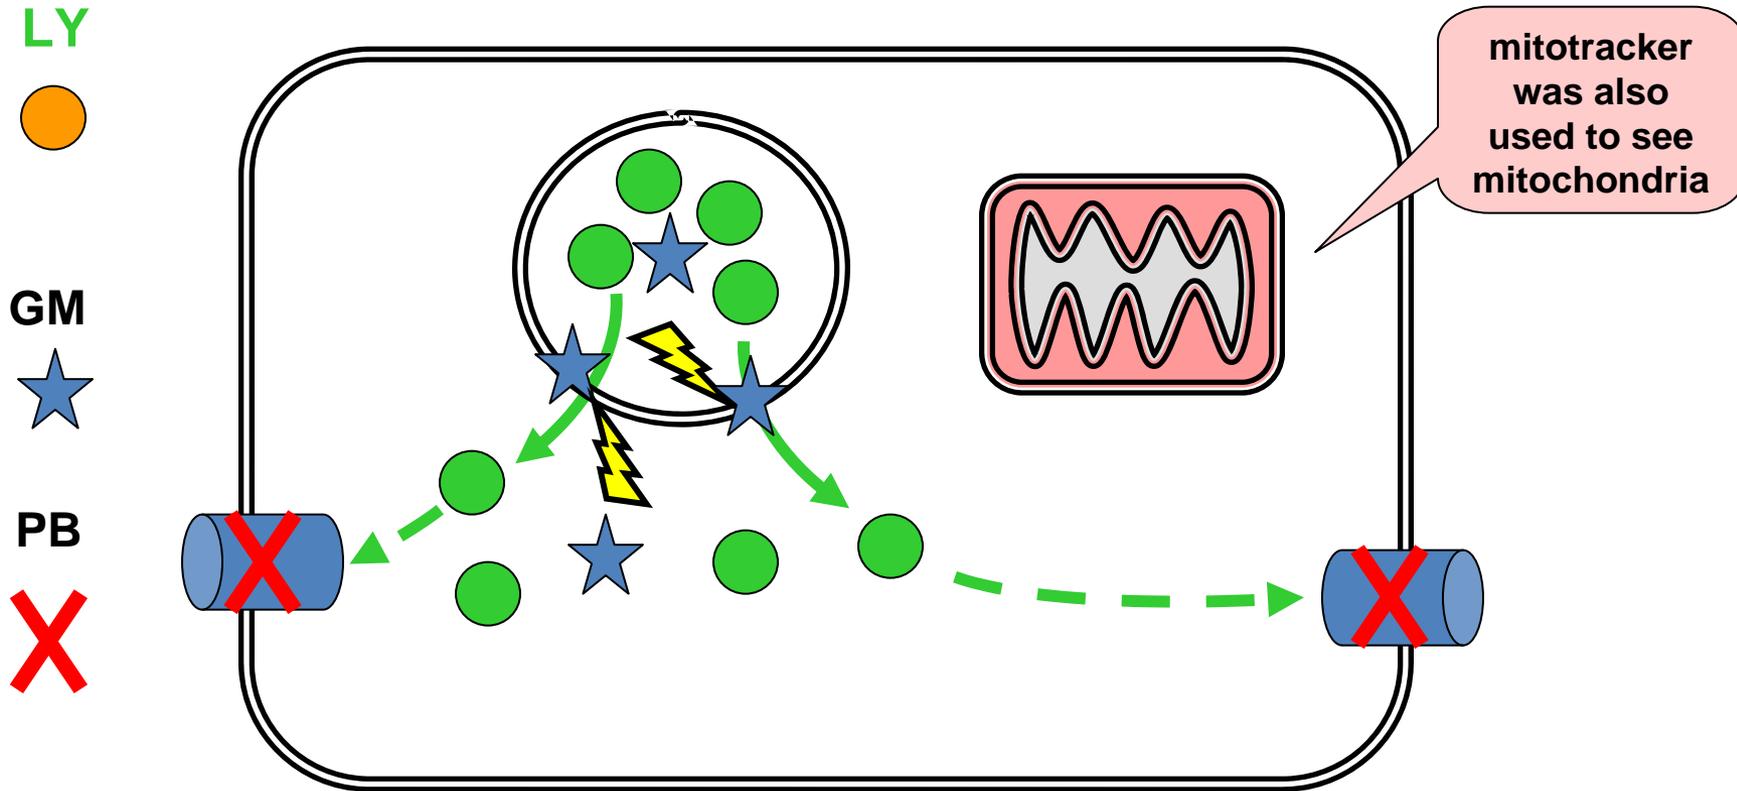

Denamur et al. Free Radic Biol Med. 2011 Jul 23.

The recent demonstration of lysosomal rupture induced by gentamicin : use of Lucifer Yellow (4 of 5)

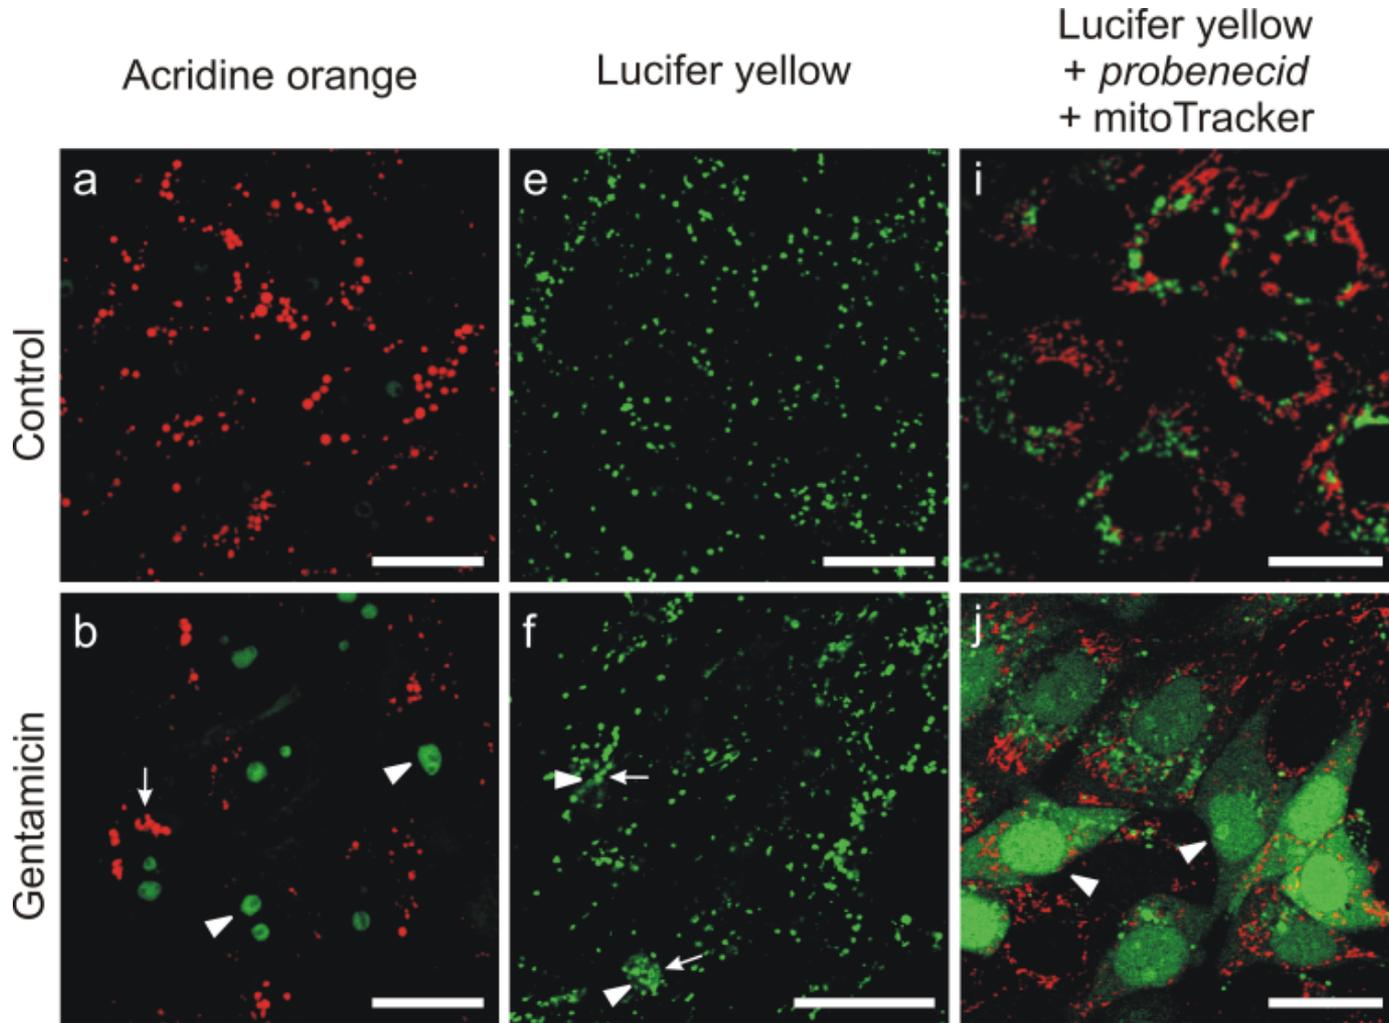

But LY is quickly effluxed through an export transporter, so that it never stays long in the cytosol ... and we did not see it ...

The recent demonstration of lysosomal rupture induced by gentamicin : use of Lucifer Yellow (5 of 5)

So, we added PB to block the efflux, and, then, we saw LY in the cytosol !

The recent demonstration of lysosomal rupture induced by gentamicin : results

Denamur et al. Free Radic Biol Med. 2011 Jul 23.

The current hypothesis...

- gentamicin enters proximal tubular cells by megalin- and acid phospholipids mediated pinocytosis and ends up in lysosomes
- a minor part escapes lysosomes either by membrane destabilization (our hypothesis) or by retrograde transport (Molitoris' hypothesis) to reach the cytosol and the mitochondria ... where it induces apoptosis and other toxic disturbances...

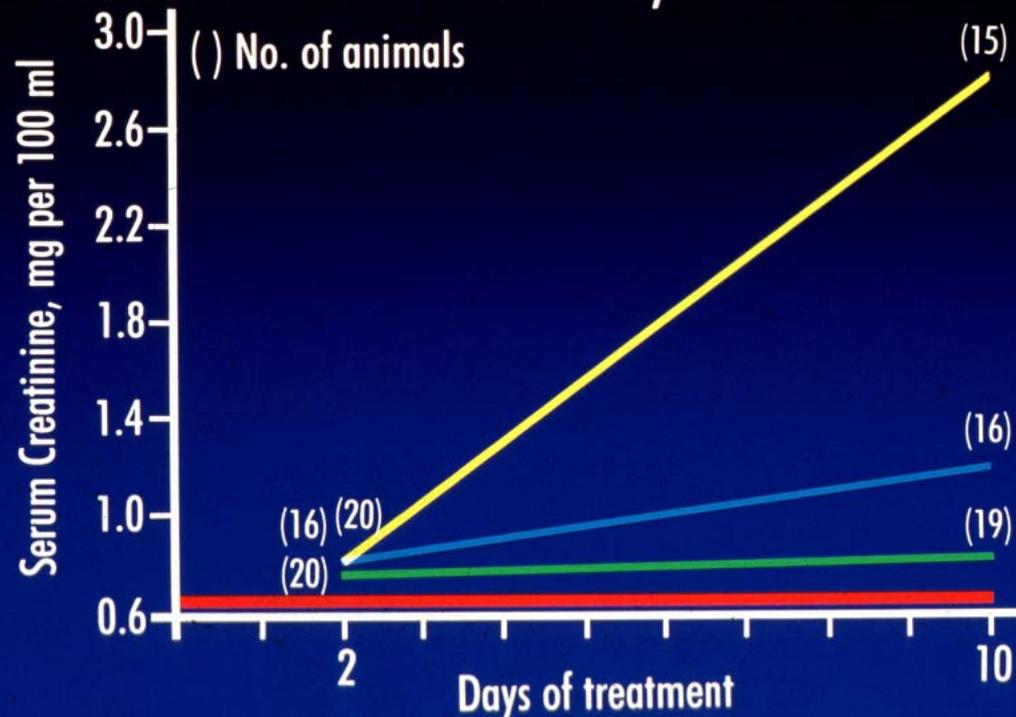

Reducing uptake by the kidney would result in reduced toxicity !

Once-a-day administration

Aminoglycoside toxicity is not linked to peak ...

Serum concentration of creatinine (mean \pm SE) in rats after administration of 40 mg of gentamicin/kg per day in one, two, or three doses for two and 10 days.

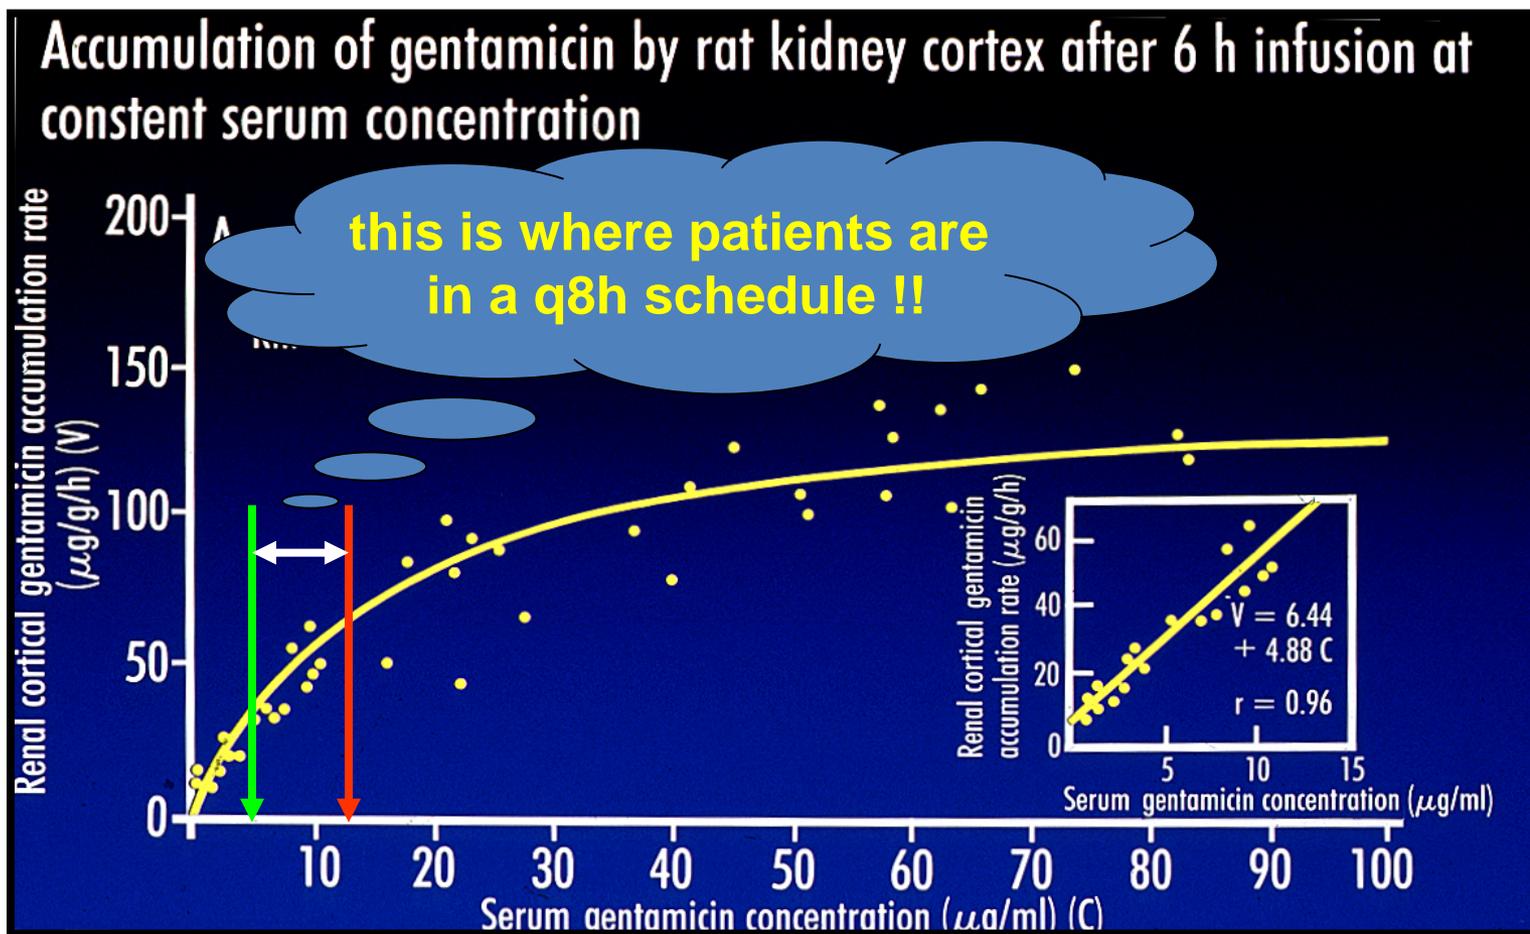

daily dose divided in :

- Three doses/day
- Two doses/day
- One dose/day
- Serum Creatinine Mean \pm 2 SE for 77 Control Rats

From Bennett et al, J. Infect. Dis., 1979

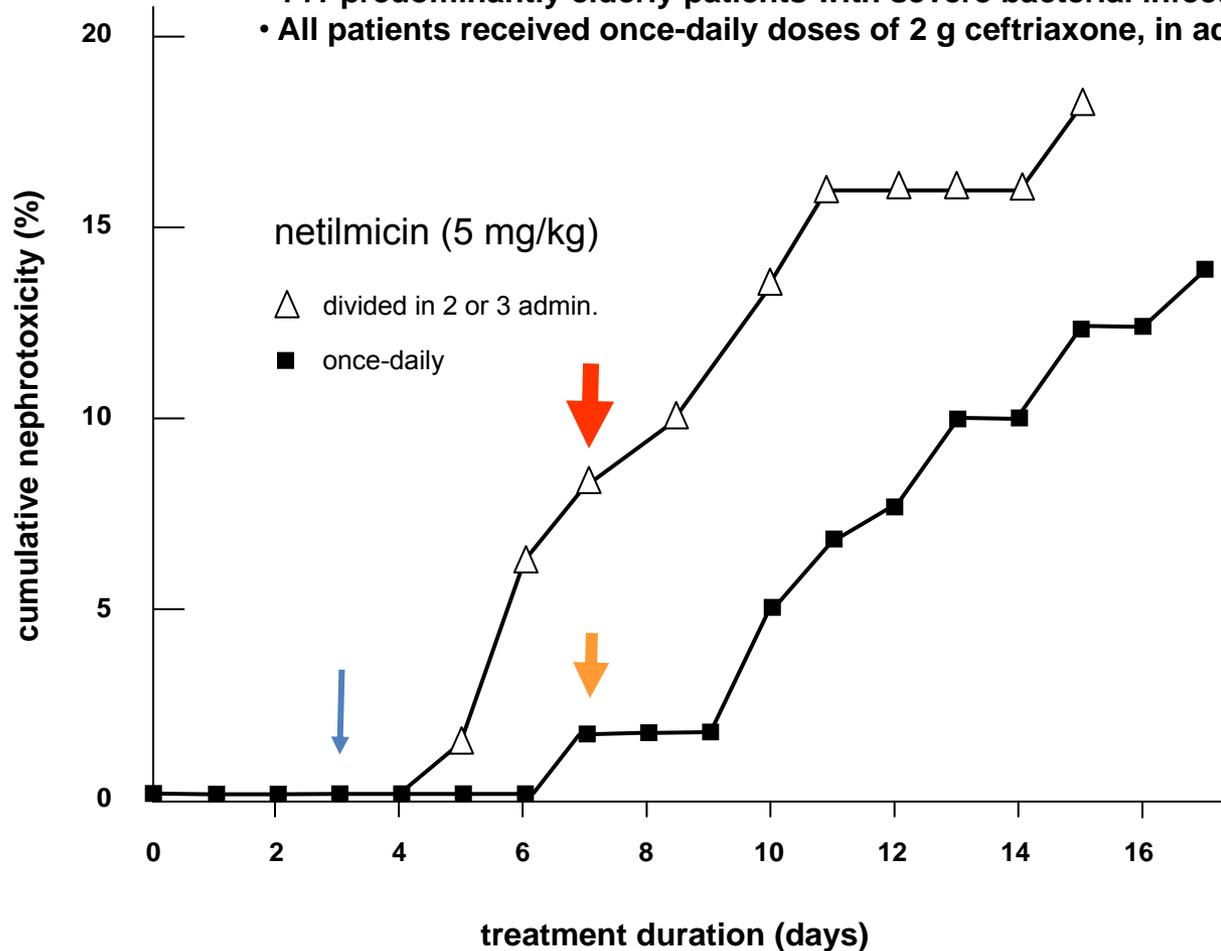

Aminoglycoside accumulation in kidney is saturable at clinically meaningful concentrations ...

Giuliano *et al.*, J. Pharm. Exp. Ther., 1986

Nephrotoxicity and schedule of administration ... the first large scale clinical trial

- 141 predominantly elderly patients with severe bacterial infections.
- All patients received once-daily doses of 2 g ceftriaxone, in addition to netilmicin.

"Netilmicin-induced toxicity may be reduced by using once-daily dosing regimens and limiting the duration of treatment."

ter Braak et al., Am J Med. 1990 Jul;89(1):58-66.

* loss of 15dB or more over baseline(max. loss recorded: 30 dB)

Avoiding (or reducing) the toxicity

Aminoglycosides 3d rule of thumb...

give them once-a-day to reduce toxicity

- **1h peaks of 12-18 $\mu\text{g/ml}$ for G, T, N**
- **1h peaks of 20-30 $\mu\text{g/ml}$ for A, I**

**Increase interval (\rightarrow 36h, \rightarrow 48h)
in case of renal failure
before reducing the unit dose...**

**Once-daily dosing of
aminoglycoside antibiotics**

DISEASE-CLINICS-OF-NORTH-
AMERICA. JUN 2000

3. Monitoring

Monitoring recommendations for the once-a-day...: peak and trough values...

- peak (1h post infusion)
 - G, T, N : 18 - 24 mg/l
 - A, I : 25 - 50 mg/L
- trough (before next dose)
 - G, T, N : < 1 mg/ L
 - A, I : < 2 mg/L

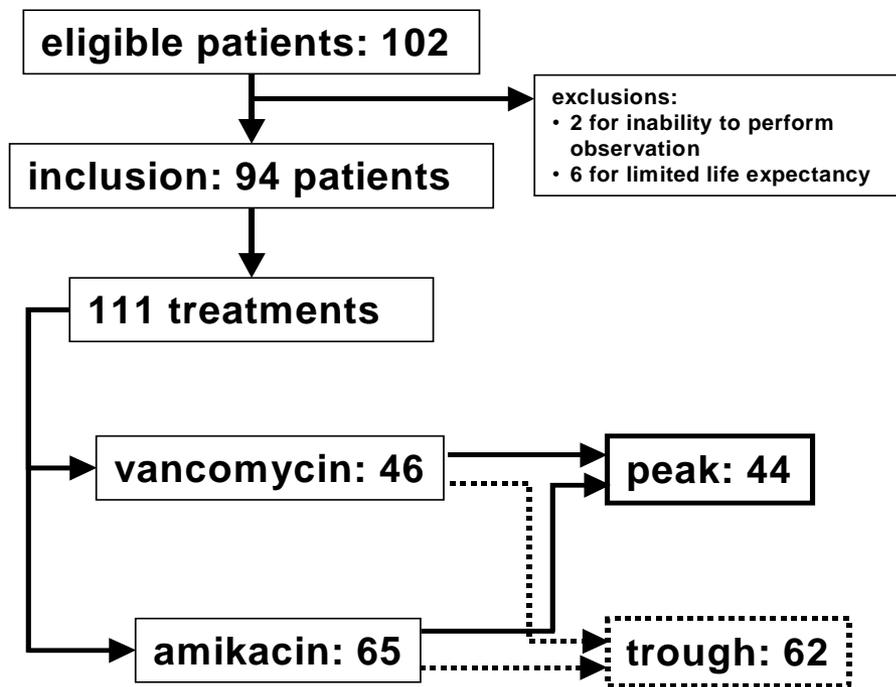

the difficulty, however, is to have good peaks

Monitoring is probably unnecessary for short duration therapies... except for efficacy...

Do not minimize the difficulties of a "good peak"

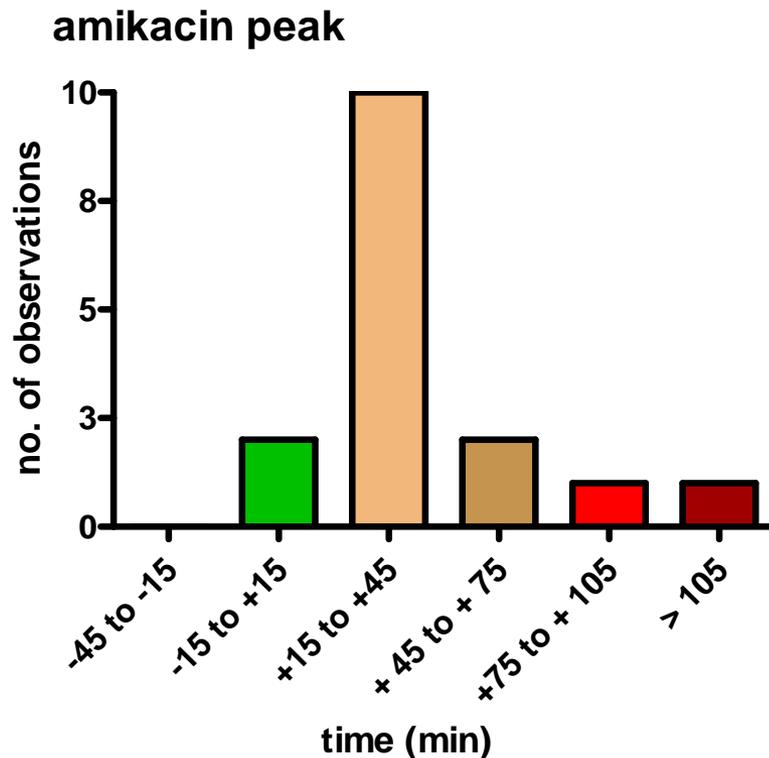

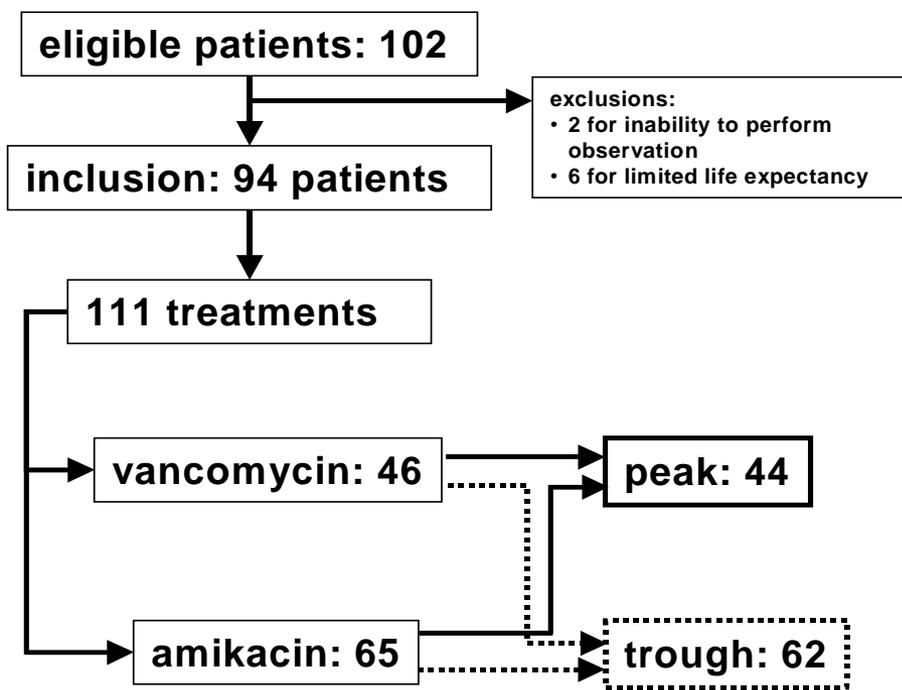

A "Clinical Pharmacy" study about the peak and trough levels of alikacin in a Belgian University Hospital

Ampe *et al.*, in preparation

Do not minimize the difficulties of a "good peak"

A "Clinical Pharmacy" study about the peak and trough levels of amikacin in a Belgian University Hospital

Ampe *et al.*, in preparation

Points to consider for a "good peak"

aminoglycoside:

influence of rate of administration on the "1h peak"

1. the "time" of the real peak is highly dependent of your rate of infusion

Data for amikacin:

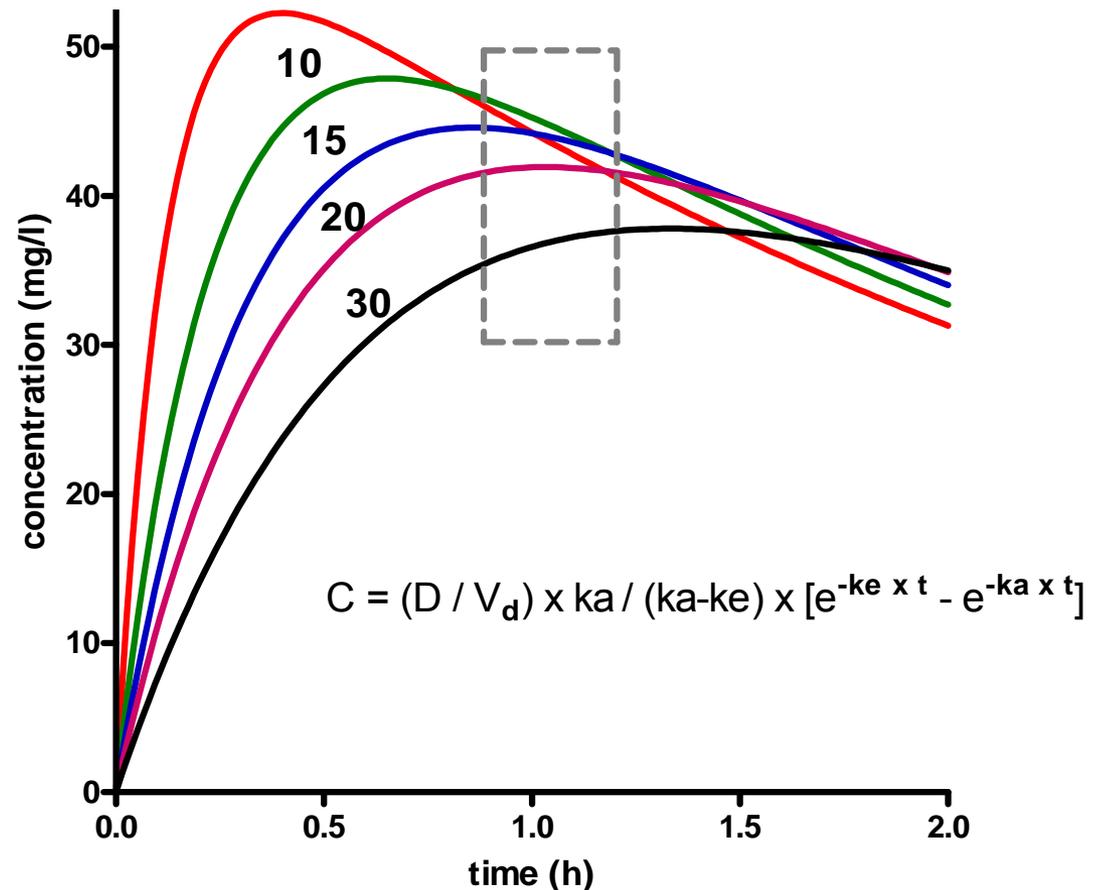

$D = 15 \text{ mg/kg}$

$V_d = 0.25 \text{ L/kg}$

$k_a = \text{variable}$

$k_e = 0.346 \text{ h}^{-1}$ ($t_{1/2} = 2\text{h}$)

$T_{1/2}$ in min = 5

Points to consider for a "good peak"

2. and the timing of the sample is even more critical

Data for amikacin:

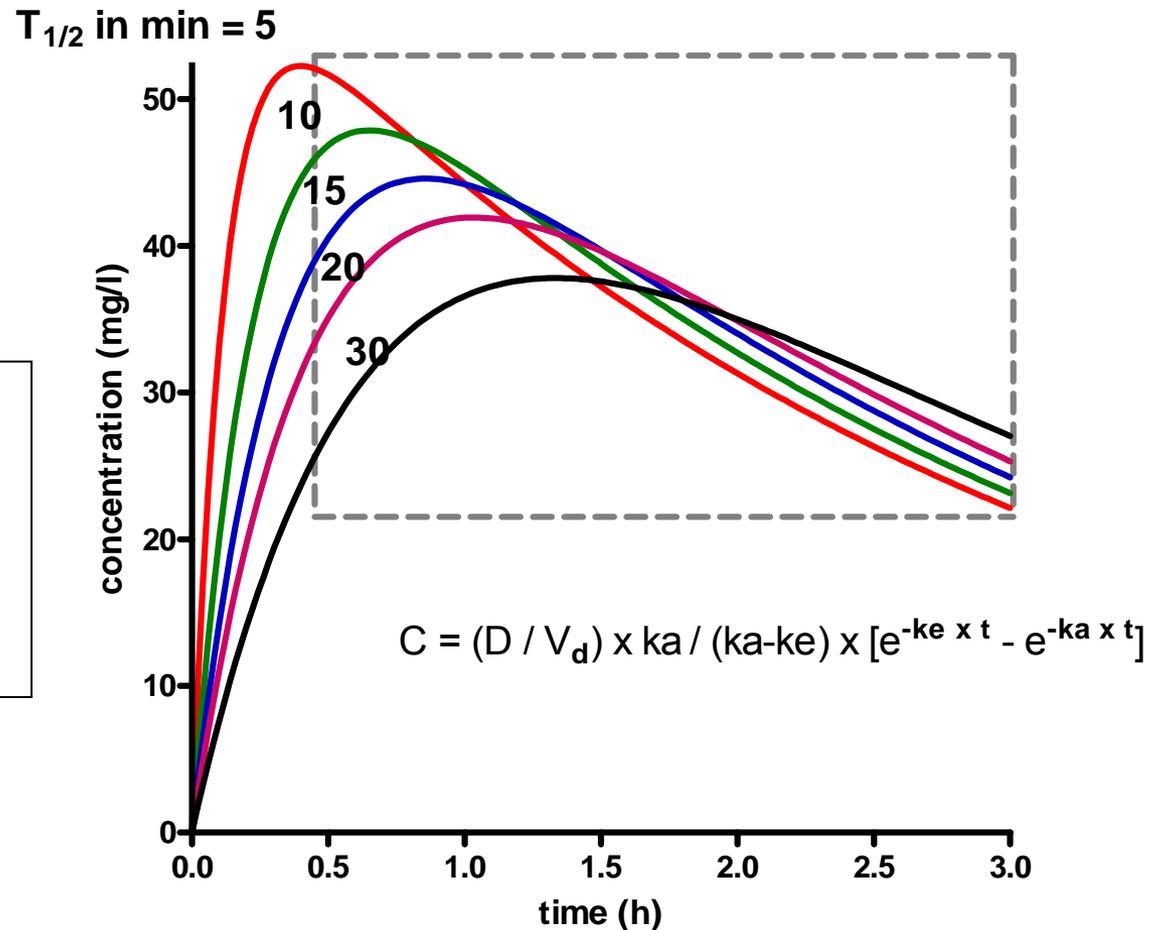

$D = 15 \text{ mg/kg}$

$V_d = 0.25 \text{ L/kg}$

$k_a = \text{variable}$

$k_e = 0.346 \text{ h}^{-1}$ ($t_{1/2} = 2\text{h}$)

aminoglycoside:
influence of actual timing of sample on the "1h peak"

The American Approach: Look for 8 h ...

All that is less
variable at 8 h !

aminoglycoside:
impact of infusion rate at 8h

$T_{1/2}$ in min = 5 to 30 min

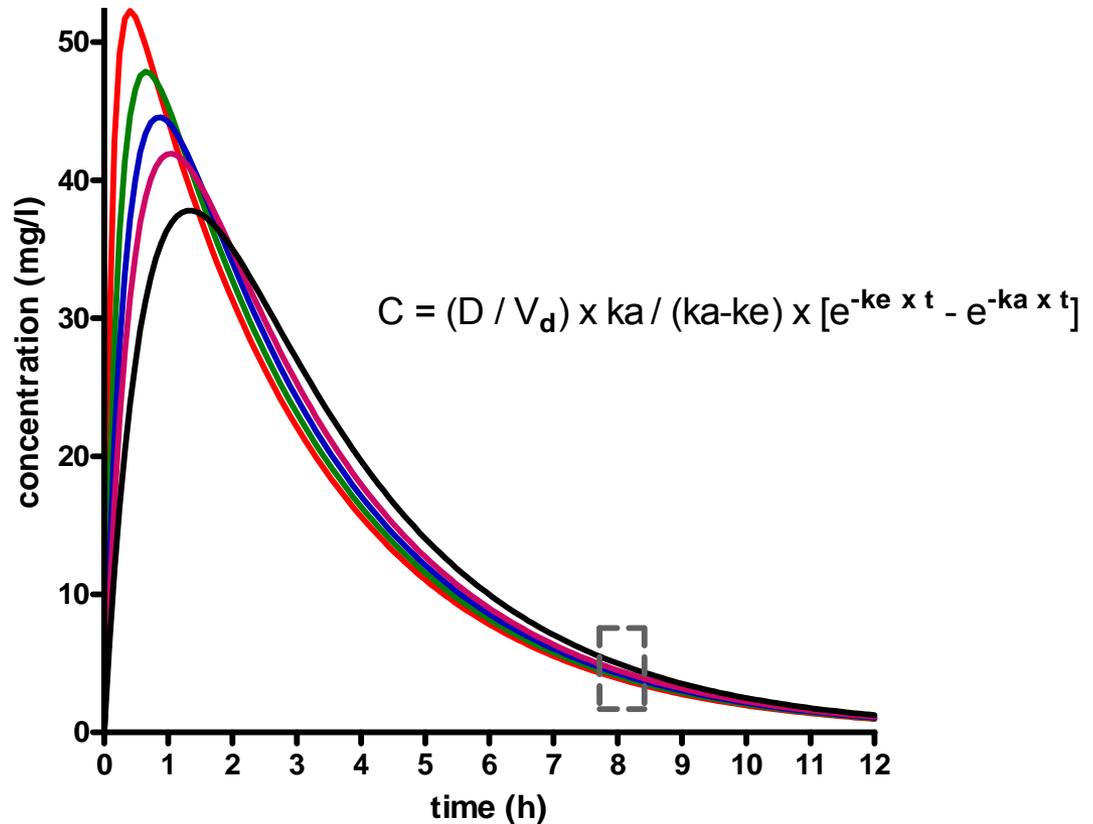

Data for amikacin:

$D = 15 \text{ mg/kg}$

$V_d = 0.25 \text{ L/kg}$

$ka = \text{variable}$

$ke = 0.346 \text{ h}^{-1}$ ($t_{1/2} = 2\text{h}$)

The American Approach: Look for 8 h

Still some variation
but will less influence
the calculation....

Data for amikacin:

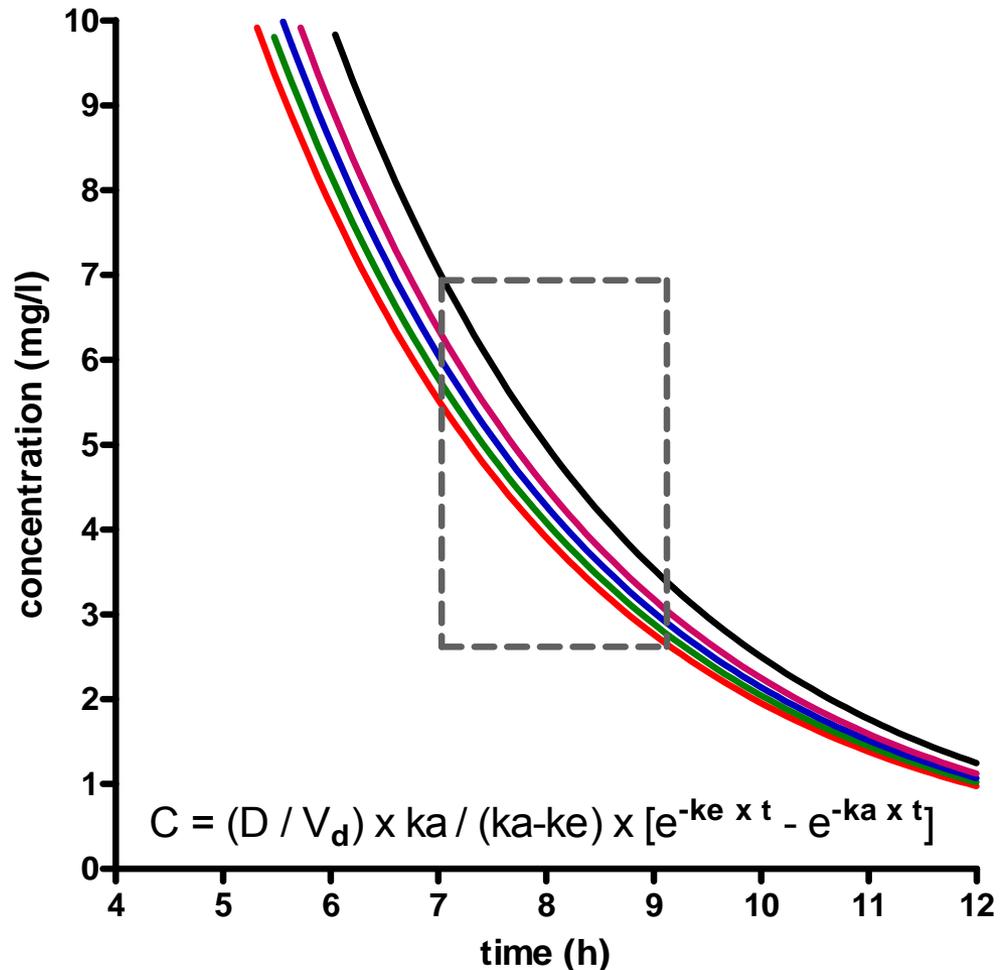

$D = 15 \text{ mg/kg}$

$V_d = 0.25 \text{ L/kg}$

$k_a = \text{variable}$

$k_e = 0.346 \text{ h}^{-1}$ ($t_{1/2} = 2\text{h}$)

aminoglycoside:
impact of infusion rate at 8h

The American Approach: Look for 8 h

Now, the important point is to detect patients with highly abnormal V_d and/or highly abnormal K_e (elimination)

Let us first see V_d

Data for amikacin:

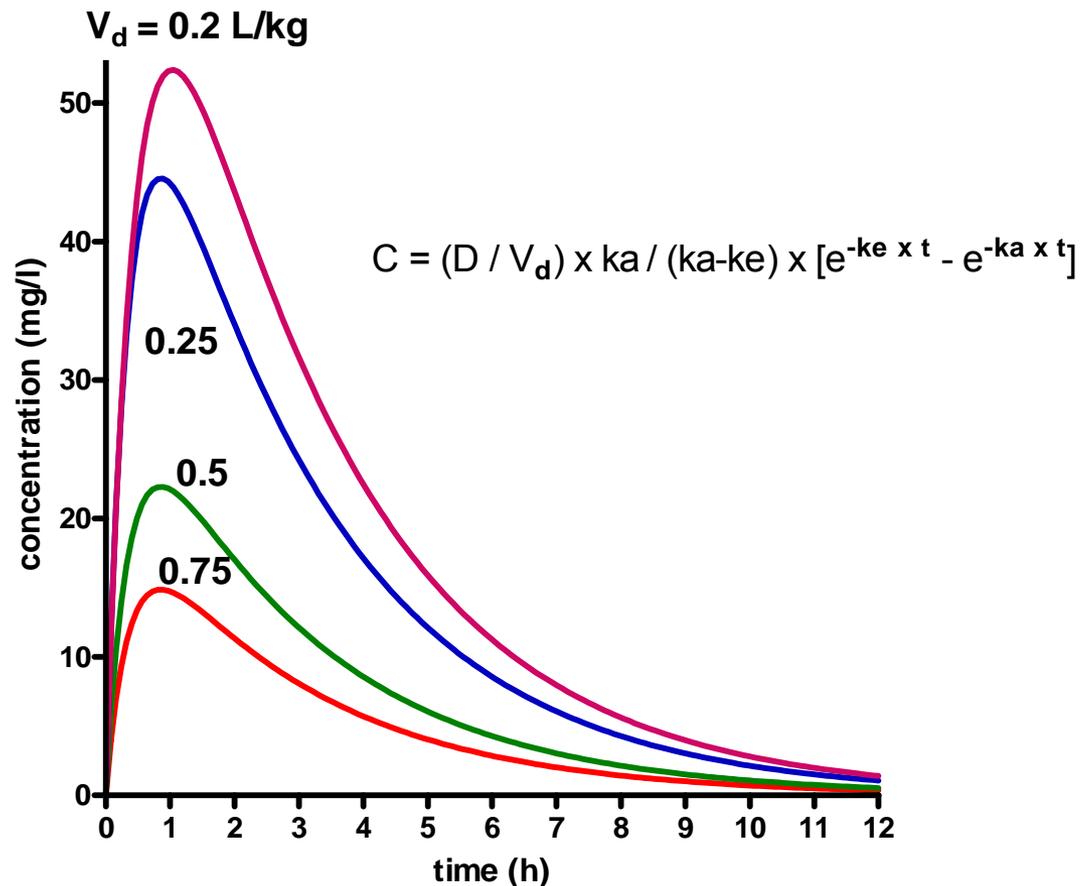

$D = 15 \text{ mg/kg}$

$V_d = \text{variable}$

$k_a = 2.772 \text{ h}^{-1}$ ($t_{1/2} = 15 \text{ min}$)

$k_e = 0.346 \text{ h}^{-1}$ ($t_{1/2} = 2 \text{ h}$)

aminoglycoside:
influence of V_d on the 0-12h levels

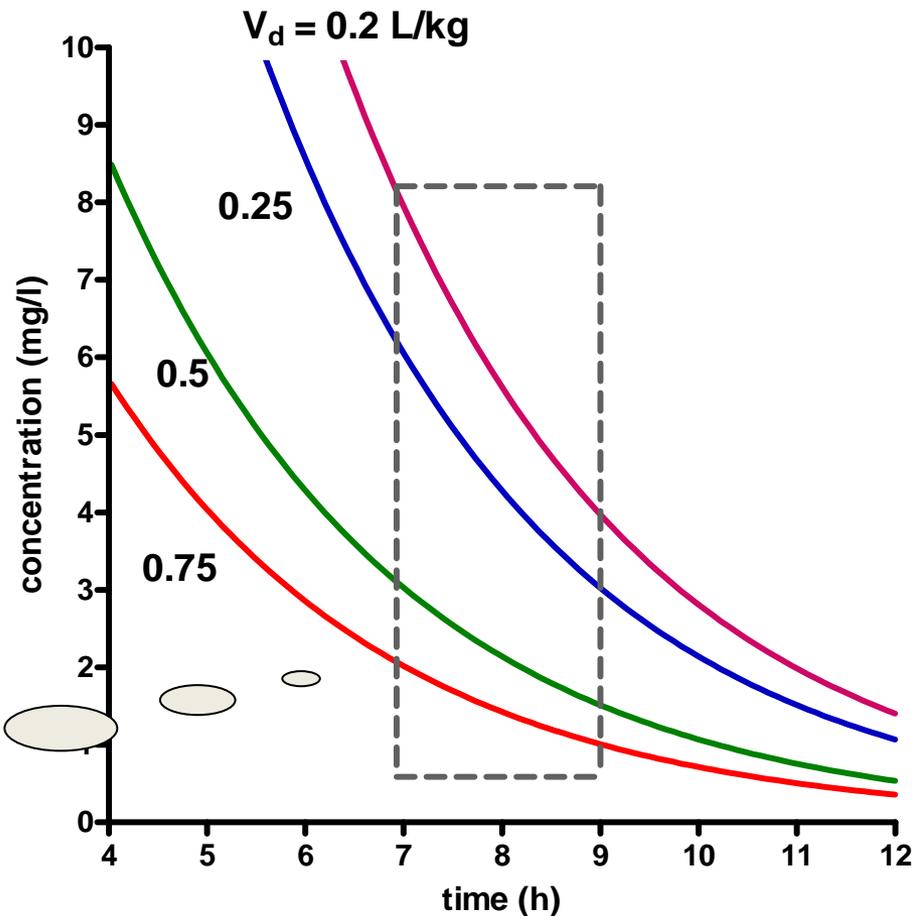

The American Approach: Look for 8 h

Now, the important point is to detect patients with highly abnormal V_d and/or highly abnormal K_e (elimination)

Let us first see V_d
and zoom at 8h ...

you will detect easily an abnormal V_d

aminoglycoside:
influence of rate of administration on the "1h peak"

The American Approach: Look for 8 h

Now, the important point is to detect patients with highly abnormal V_d and/or highly abnormal K_e (elimination)

Let now see the elimination (K_e)

Data for amikacin:

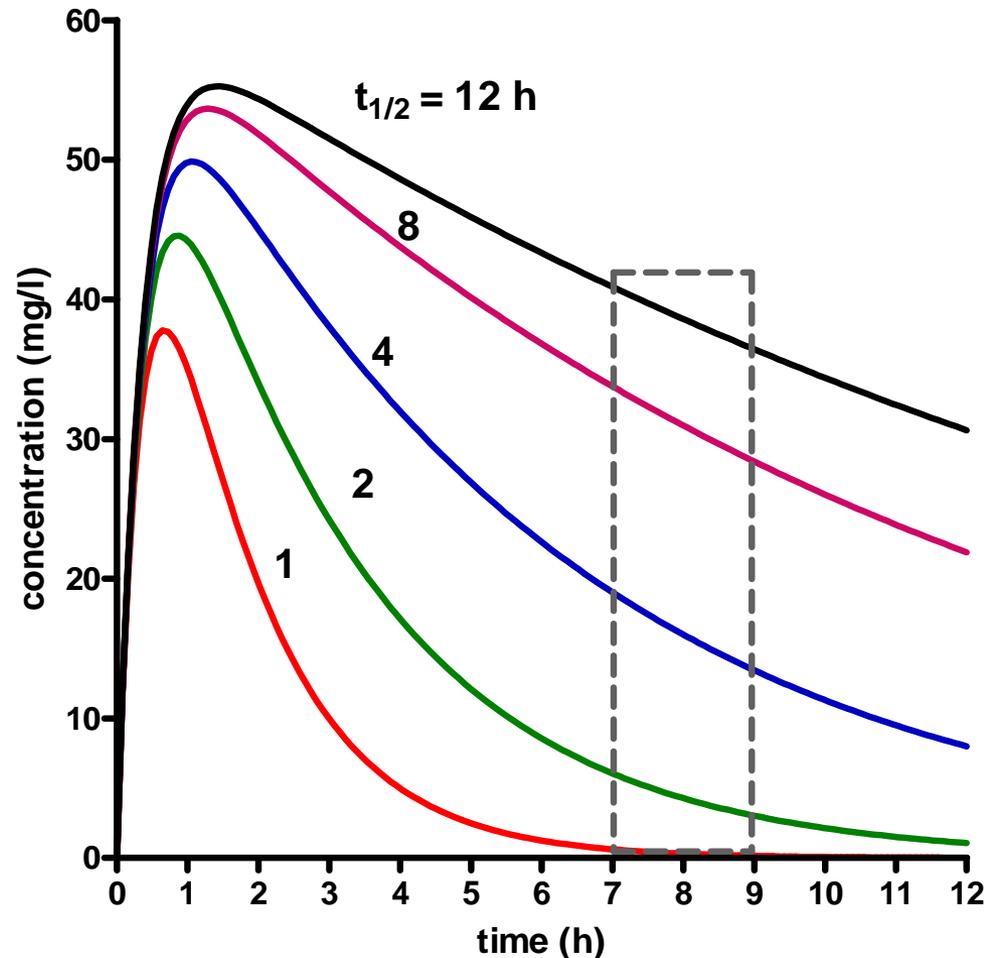

$D = 15 \text{ mg/kg}$

$V_d = 0.25 \text{ L/kg}$

$k_a = 2.772 \text{ h}^{-1}$ ($t_{1/2} = 15 \text{ min}$)

$k_e = \text{variable}$

aminoglycoside:
influence of $T_{1/2}$ on the 0-12h levels

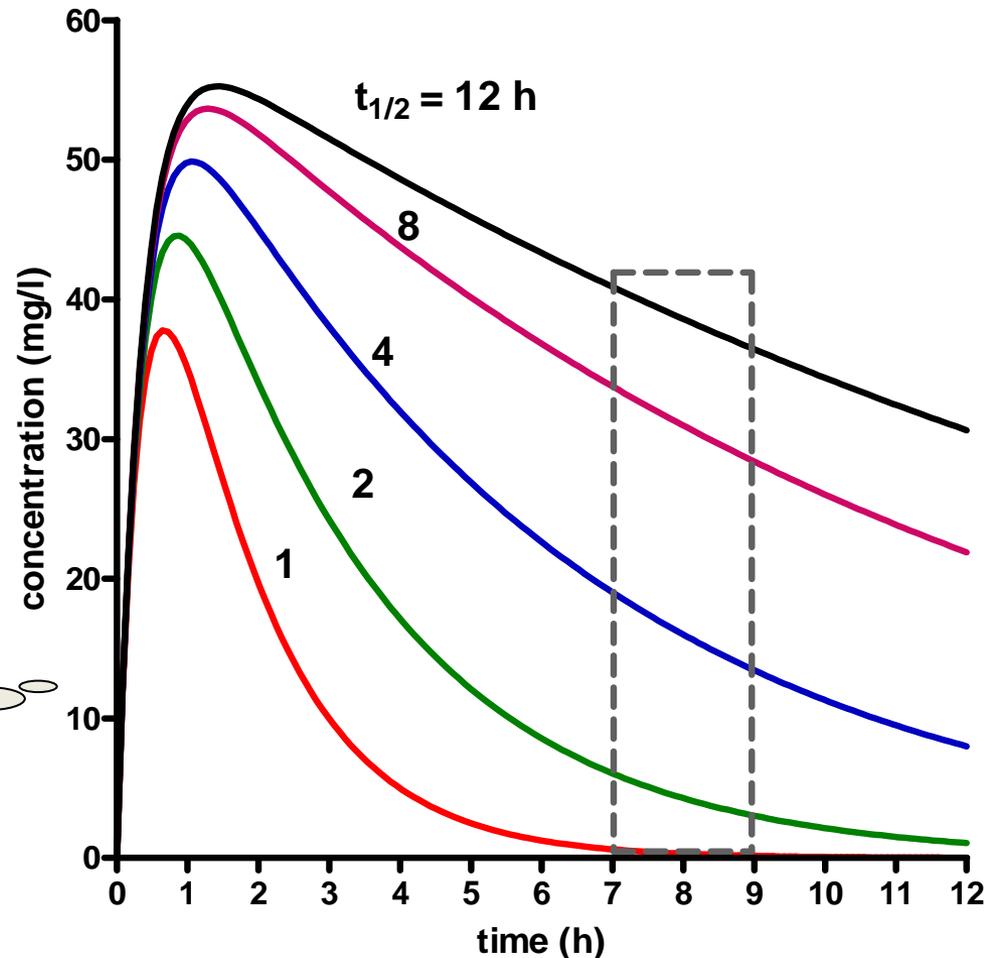

The American Approach: Look for 8 h

aminoglycoside:
influence of $T_{1/2}$ on the 0-12h levels

Now, the important point is to detect patients with highly abnormal V_d and/or highly abnormal K_e (elimination)

Let now see the elimination (K_e)

you do not even need to zoom !

Take it easy : Hartford method (Nicolau's nomogram for gentamicin)

Take home message

- Maximize peak to increase efficacy and reduce toxicity
- Administer once-a-day
- Measure MIC and calculate the dose that is needed
- Reduce treatment duration as much as possible
- Do monitoring if
 - treatment > 5 days
 - special populations
 - risk factors
 - co-administration of other nephrotoxic drugs
