Noyaux du raphé dorsal et médian.

Les neurones provenant du raphé se projettent vers le ganglion basal et les diverses parties du système limbique, avec une large distribution dans l'ensemble du cortex cerebral.

Le glutamate est le principal neurotransmetteur

- des cellules thalamocorticales
- des cellules pyramidales
- des cellules corticostriées
- de l'hippocampe

RECEPTEURS AU GLUTAMATE

Table 10.1 Structural and Functional Properties of Excitatory Amino Acid Receptors

Receptor subtype	Superfamily	Properties		
		Genes	Cation selectivity	Second messengers
AMPA	Ligand-gated channel	<i>GluR1–GluR4</i>	Na ⁺ , K ⁺	
Kainate	Ligand-gated channel	<i>GluR5–GluR7, KA1, KA2</i>	Na ⁺ , K ⁺	
NMDA	Ligand-gated channel	<i>NR1, NR2A–NR2D</i>	Na ⁺ , K ⁺ , Ca ²⁺	
Metabotropic	G protein-coupled receptor	<i>mGluR1–mGluR7</i>		IP ₃ , DAG, cAMP

Analogues synthétiques

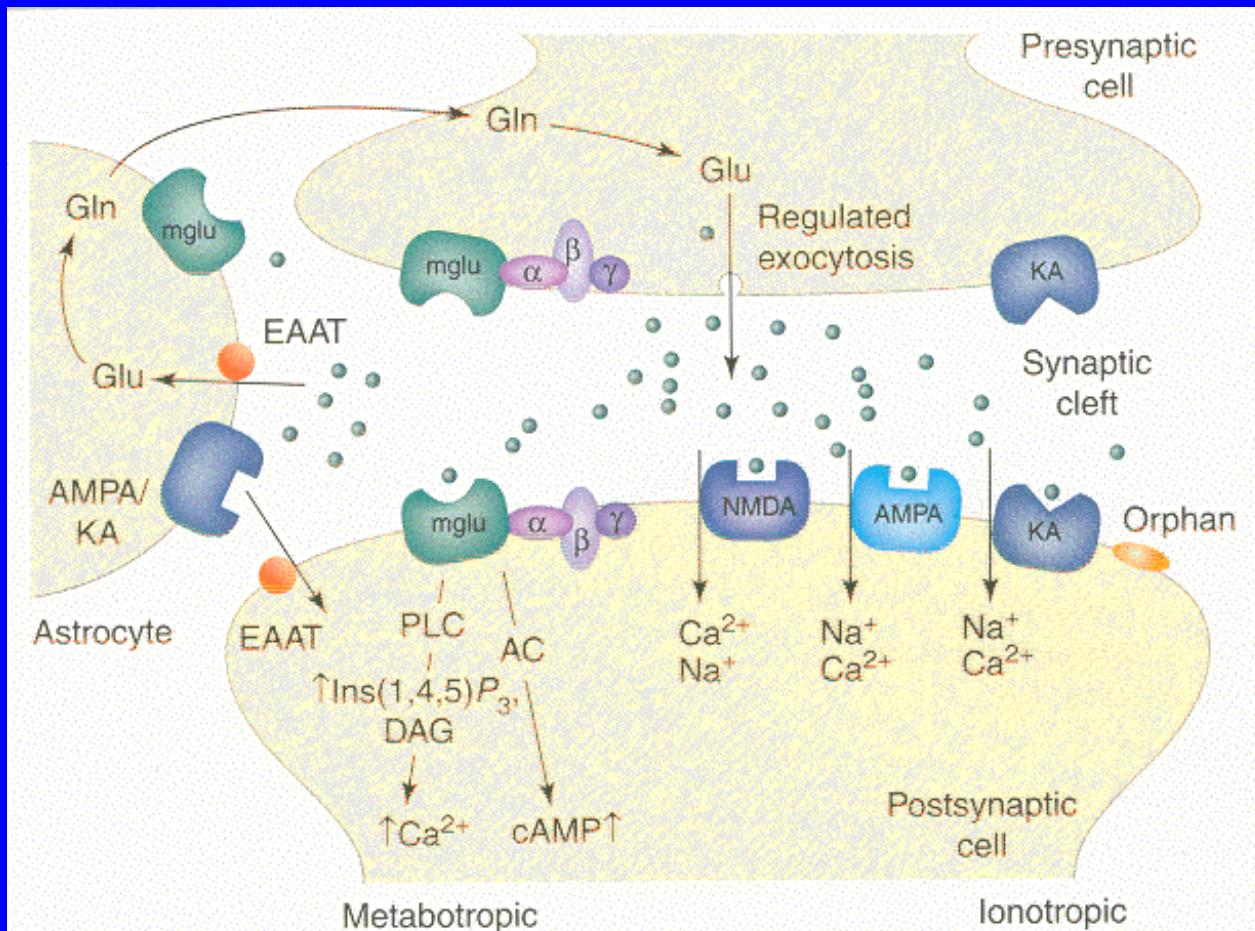

NMDA: N-méthyl-D-aspartate

AMPA: acide α -amino-3-hydroxy-5-methyl-4-isoxazole propionique

Natural compound isolated from seaweed *Digena simplex*

Kainic acid

GLUTAMATE ET TRANSDUCTION DU SIGNAL

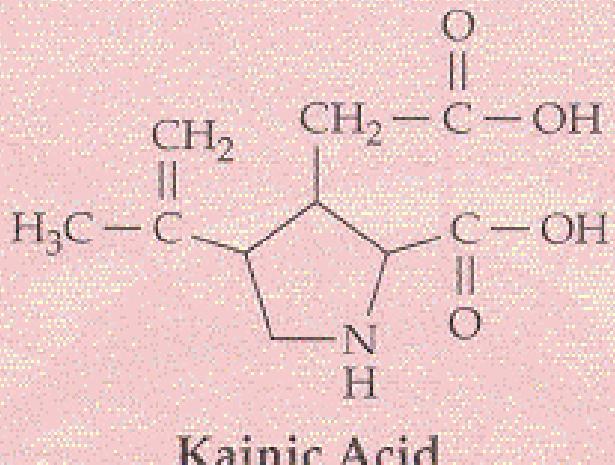

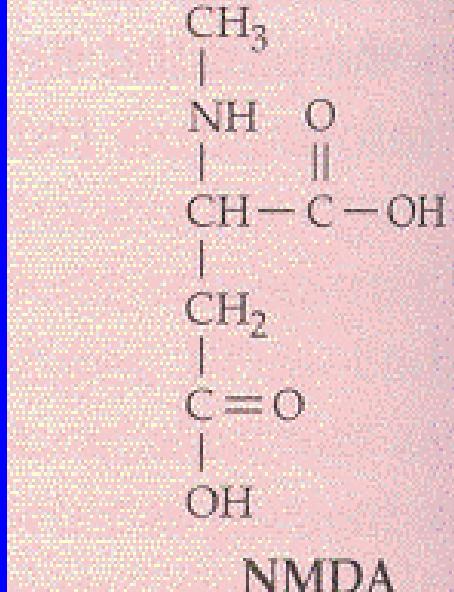

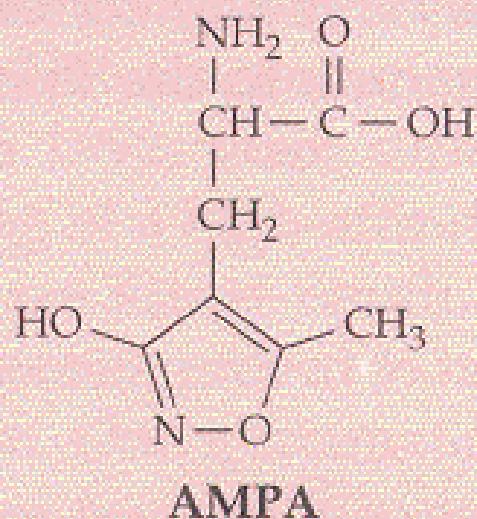

Metabotropic

Group I	Group II	Group III
mglu ₁	mglu ₂	mglu ₄
mglu ₅	mglu ₃	mglu ₆ mglu ₇ mglu ₈

Ionotropic

NR1	GluR1	GluR5	$\delta 1$
NR2A	GluR2	GluR6	$\delta 2$
NR2B	GluR3	GluR7	
NR2C	GluR4	KA1	
NR2D		KA2	
NR3A			

STRUCTURE OF AMPA, NMDA, KAINATE

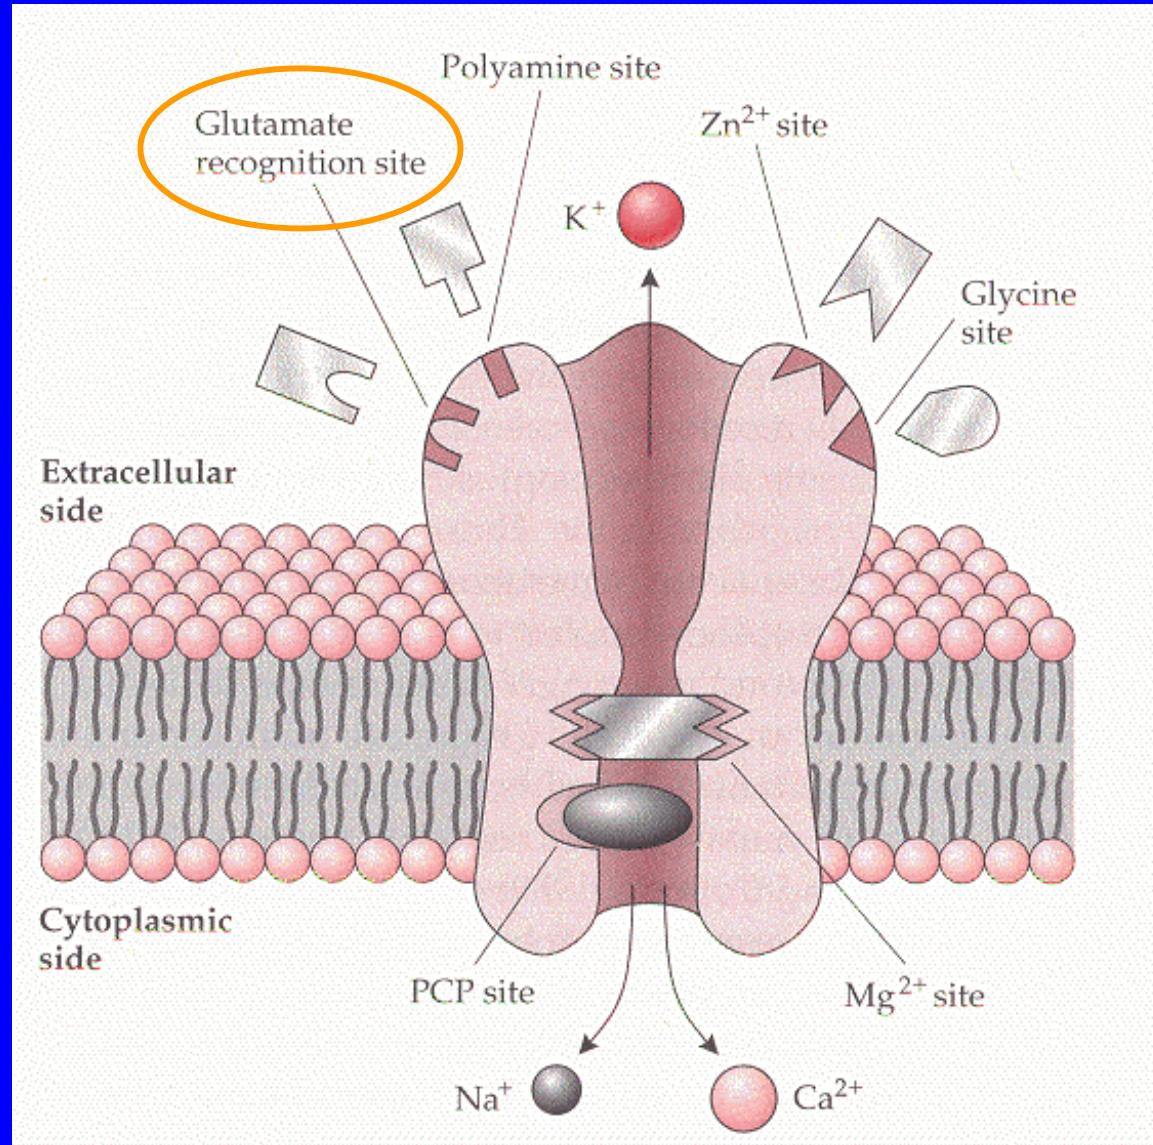

NMDA: N-méthyl-D-aspartate

AMPA: acide α -amino-3-hydroxy-5-methyl-4-isoxazole propionique

RECEPTEURS AU GLUTAMATE AGONISTES ET ANTAGONISTES

Receptor	Agonists	Antagonists
AMPA/Kainate	AMPA, kainic acid, quisqualic acid, domoic acid	CNQX, NBQX
NMDA	NMDA	CPP, D-AP5 (D-APV), D-AP7
Metabotropic	Quisqualic acid, <i>trans</i> - ACPD, L-AP4	α -Methyl-4-carboxyphenyl glycine

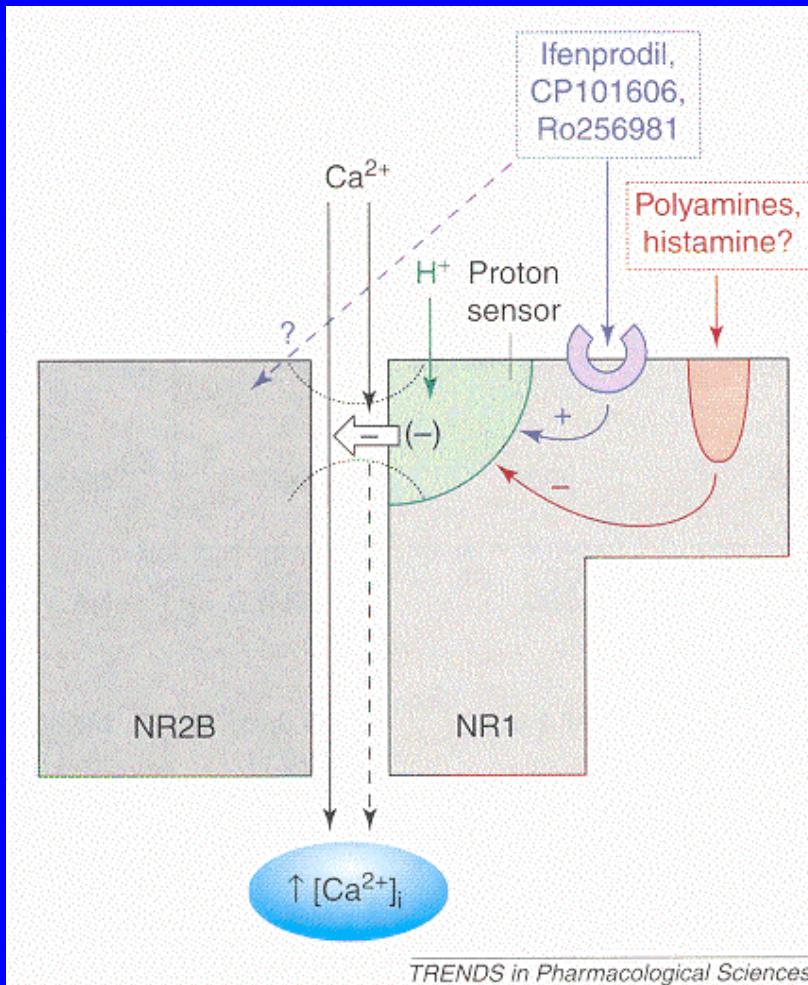

RECEPTEURS NMDA AU GLUTAMATE

Phenylcyclidine = PCP

RECEPTEURS NMDA

Interactions between endogenous modulators and ifenprodil-like selective antagonists of NR2B-containing NMDA receptors

A protonated H⁺-sensor stabilizes the NR1-NR2B heterodimer in low-conductance state

Polyamines (spermine, spermidine) shield the H⁺-sensor from protons thus attenuating the inhibition by proton and potentiating the influx of Ca²⁺

Ifenprodil enhances the sensitivity to protons

From Chizh et al. *TiPS* 22: 636-642 (2001)

RECEPTEURS METABOTROPIQUES AU GLUTAMATE

GROUP I
Activation de la phospholipase C
(Proteine Gq)

GROUPS II and III
Inhibition of adenylate cyclase
(Proteine Gi)

Receptor group	Receptor subtypes	Signal transduction
I	mGlu _{1α} mGlu _{1β} mGlu _{1d} mGlu _{1e} mGlu _{5a} mGlu _{5b}	
II	mGlu ₂ mGlu ₃	
III	mGlu _{4a} mGlu ₆ mGlu _{7a} mGlu _{7b} mGlu _{7c} mGlu _{7d} mGlu _{7e} mGlu _{8a} mGlu _{8b}

FARM 2146 - 2003-2004

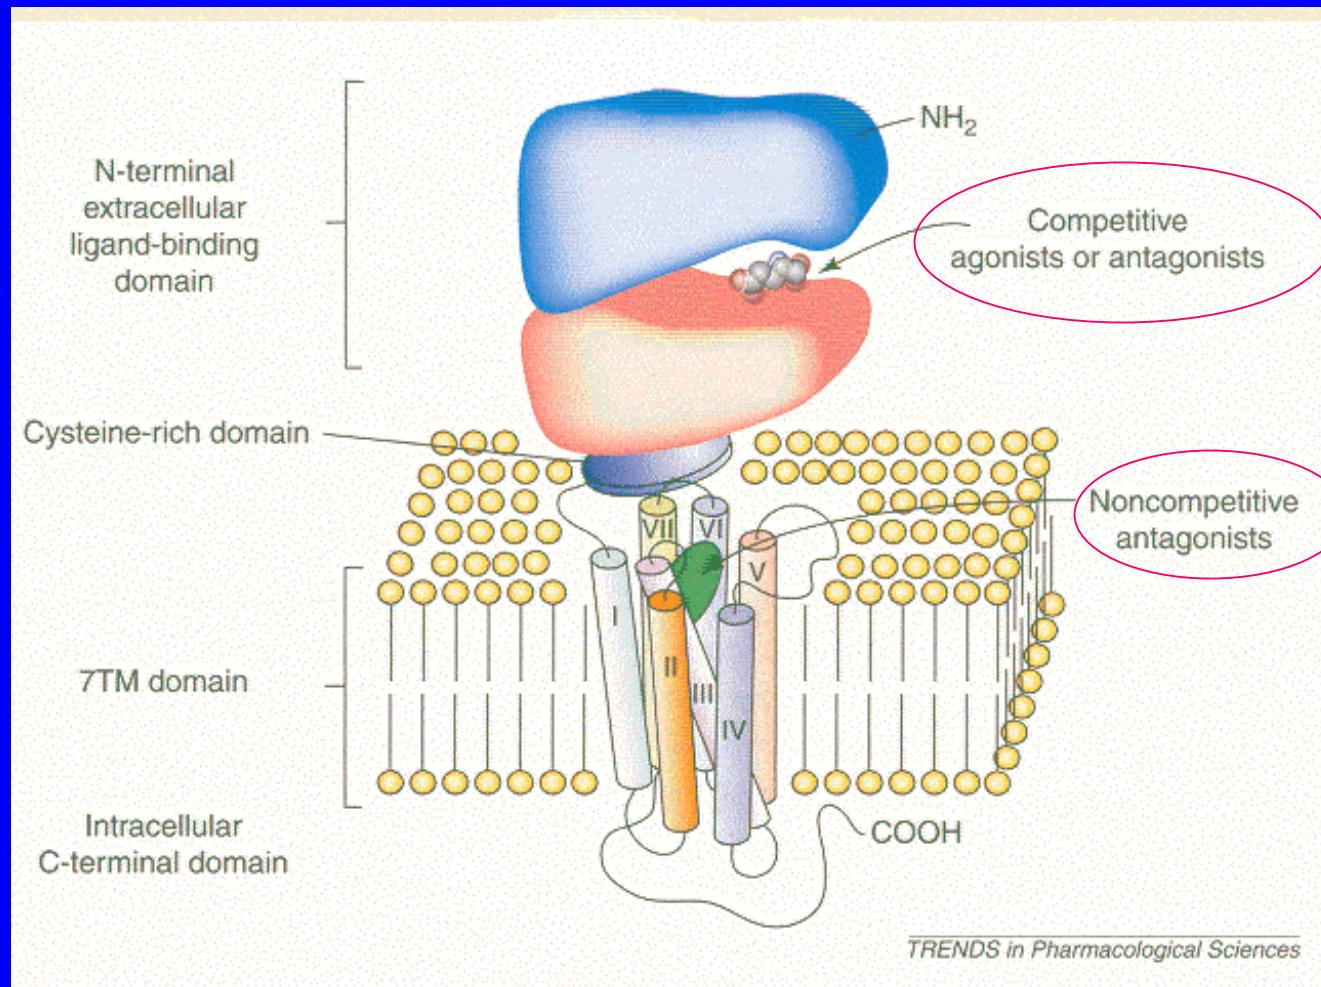

Members of group II and III can be differentiated by their specific agonists

RECEPTEURS METABOTROPIQUES AU GLUTAMATE - LOCALISATION

Acb: nucleus accumbens
Hi: hippocampus
IC: inferior colliculus
LS: lateral septal nucleus
OT: olfactory tubercle
SC: superior colliculus
SpV: spinal trigeminal nuclei
Th: thalamus

RECEPTEURS METABOTROPIQUES AU GLUTAMATE mGlu5 - STRUCTURE OF THE MONOMERIC FORM

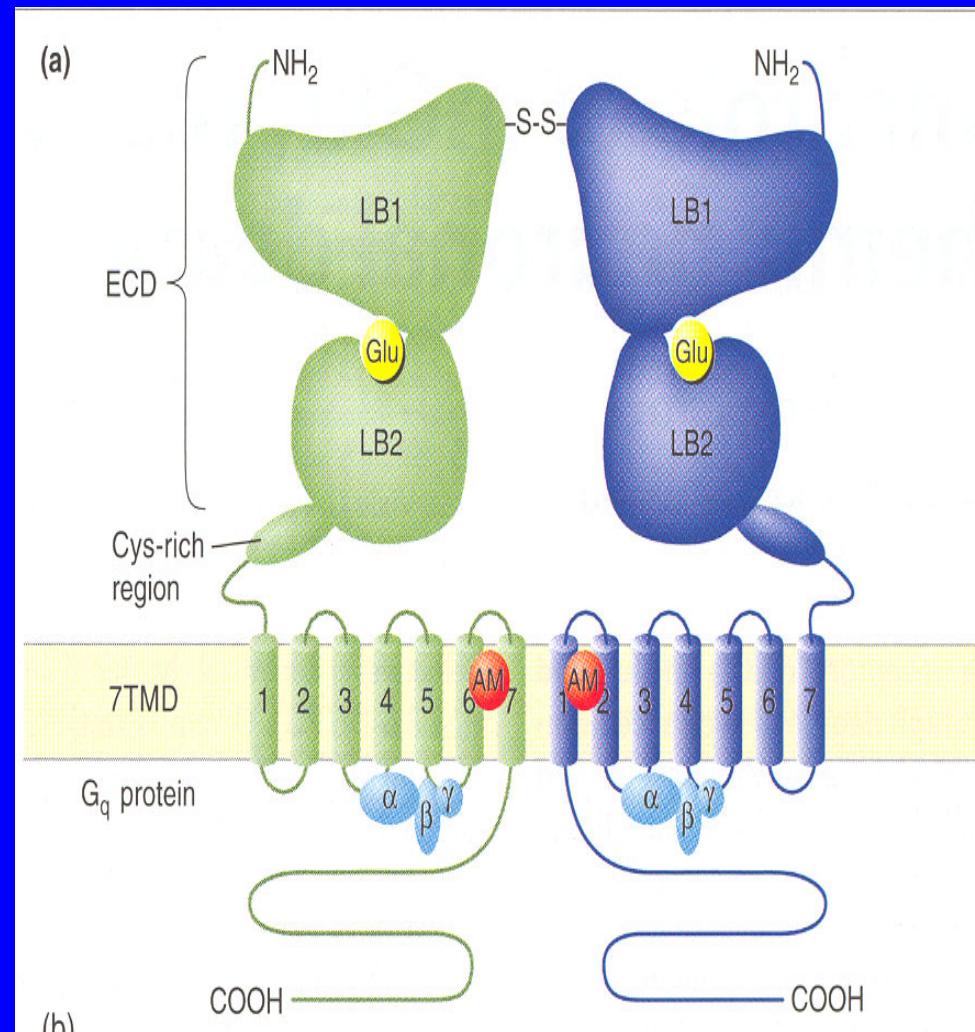

TRENDS in Pharmacological Sciences

RECEPTEURS METABOTROPIQUES AU GLUTAMATE

Agonist binding site is located in the large N-terminal extracellular domain which is connected to the seven-transmembrane G-protein-coupled receptor by a cysteine rich linker

Residues within intracellular loops 2 and 3 appear to be crucial for G-protein coupling selectivity and activation

C-terminal tail contains residues that are involved in the protein kinase C-induced desensitization of the receptor and in the interaction with intracellular proteins

ECB: Extracellular domain

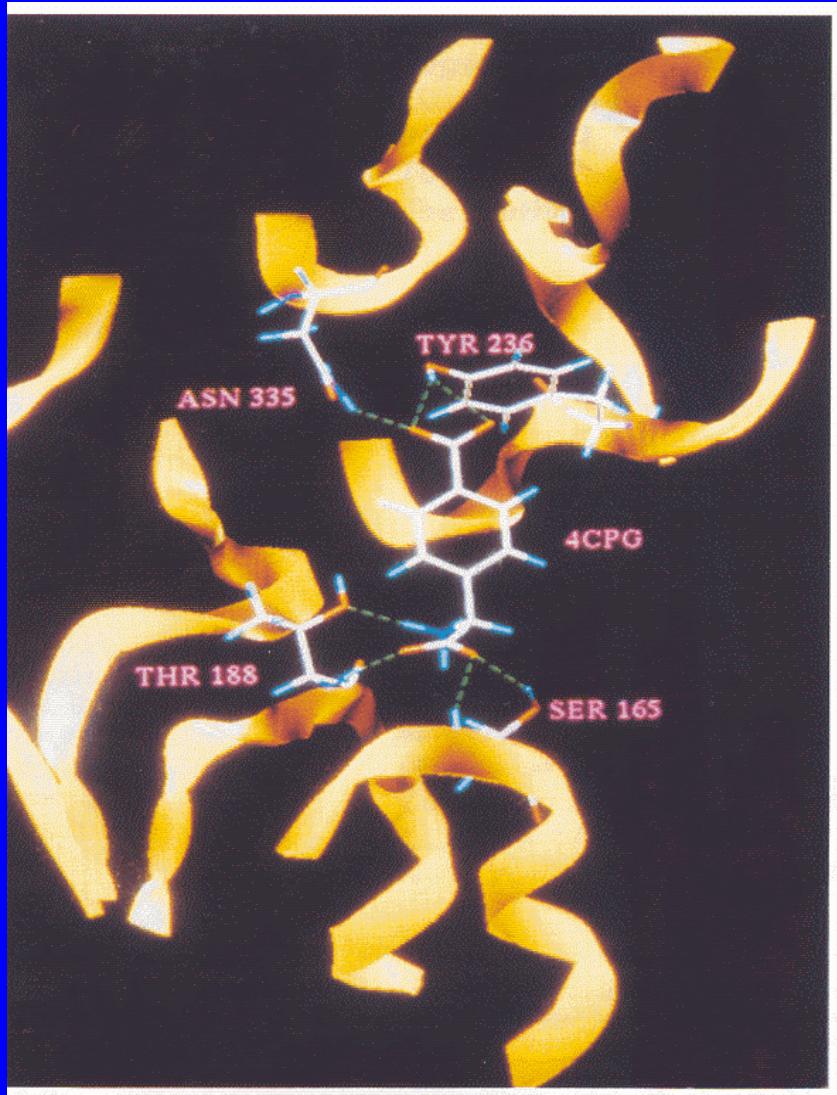

LB: ligand binding lobes

AM: allosteric modulators

GLUTAMATE –GABA INTERACTIONS

POSSIBLE EXPLANATION FOR THE NEUROPROTECTIVE EFFECTS OF METABOTROPIC GLUTAMATE 1 RECEPTOR ANTAGONISTS

(1) Excessive activation of postsynaptic AMPA and NMDA receptors by glutamate produces a sustained depolarizing influx of Na^+ and Ca^{2+} , which eventually leads to neurodegeneration

(2) Activation of postsynaptic GABA_A receptors produces an influx of Cl^- , hyperpolarization and neuroprotection

(3) GABA can also interact with presynaptic GABA_B receptors that negatively control the release of glutamate, thus leading to reduced excitation of postsynaptic neurons

(4) The release of GABA is negatively-controlled by mGlu1 receptors and cannabinoid CB1 receptors, via suppression of Ca^{2+} currents through N-type channels or activation of K⁺ channels

Antagonists of mGlu1 receptors can lead to increased release of GABA and therefore to neuroprotective hyperpolarization

- Direct blockade of presynaptic mGLU1 receptor on GABAergic terminals
- Indirect inhibition of CB1 receptors located on GABAergic terminals prompted by mGlu1 receptors located postsynaptically
